PRODUCT OVERVIEW	

I. Rationale

The South Orange Maplewood School District believes students should be engaged in the use of technology to excel in various areas of their lives including academics, civic duties, the work place, and within an ever-changing global society. As technology becomes increasingly important in today's world, it is invaluable to not only learn how to use technology, but also to understand how to create it. Technology is the future, and today's kids are tomorrow's technologists. Robotics is a multi-disciplinary tool that is being increasingly used by over 5,000 schools worldwide to motivate, excite and inspire children about math and science.

Robotics inspires students to make connections across several disciplines rather than learning topics in isolation as it combines mechanical, electronic, electrical and programming skills. Students are motivated to learn by creating their own robotic devices, while at the same time gain a deeper understanding of interdisciplinary fields of study. In addition, robotics appeals to a broad range of students and allows multiple points of access to science and technology for a variety of learners.

Robotics is already playing a very pivotal and cutting edge role in diverse sectors such as manufacturing, avionics, medicine, defense, automobile, and entertainment to name a few.

At the high school level the focus can be either on introductory or a deeper understanding of a specific skill set; i.e. programming or mechanical design. Robotic programs include the development of 21st century skills; teamwork, problem solving, ideation, project management, communications. It is our goal to provide our students with the opportunity to explore the field of robotics, providing an education that not only meets, but exceeds world standards.

II. Purpose

Technology is increasingly becoming more important in the lives of our children. They are what society has deemed Digital Natives. A Digital Native as defined by popular culture is any child born after 1982; this would include all of our students. The Digital Native has grown up with technology at their fingertips. They are equally as comfortable with a keyboard and a touch screen as past generations are with pen and paper. The students of this generation have access to multimedia technology in the form of cell phones, I-pods, laptops, television, and the internet. They can retrieve and create information on YouTube, blog information through any number of sites, and send out podcasts of themselves doing a myriad of activities. However, research has suggested that these same students who are so comfortable with technology have little conceptual understanding of technology, how it works, why it works, and the ramifications of its use. This sets our premise for providing students with instruction on the use of such powerful tools.

Furthermore, The NJDOE's Technological Literacy Standards 6A:8-1.1 states that the purpose of this curriculum should be:

To prepare students for success in life, future education, and work in an economy driven by information, knowledge, and innovation requires a public education system where teaching and learning are aligned with 21st century learning outcomes. These outcomes move beyond a focus on basic competency in core subjects and foster a deeper understanding of academic content at much higher levels by promoting critical thinking, problem solving, and creativity.

Through this curriculum, South Orange Maplewood School District will provide students with an increased knowledge of how to utilize technology to:

- *Enhance problem solving skills*
- *Compile data to formulate solutions to real world problems*
- *Build/engineer a tool to assist with everyday activities*
- *Discuss social and ethical responsibilities in the use of technology*
- *Develop products/models that address societal issues*
- *Examine the relationship that exist between software functions and daily activity*
- *Build logical thinking*
- *Develop innovation and creativity*
- *Increase teamwork skills*
- *Provides a visual grasp of math and science*
- *Analyze how technology can be used to improve the design and functionality of the environment*

III. Description

This curriculum has been developed to assist students in becoming technology literate. Robotics technology is a pillar of 21st century American innovation. It highlights the growing importance in a wide variety of application and emphasizes its ability to inspire technology education.

Robotics is positioned to fuel a broad array of next-generation products and applications in fields as diverse as manufacturing, health-care, national defense and security, agriculture and transportation. Robotics enable participants of all ages to learn important Science, Technology, Engineering and Math (STEM) concepts and at inspiring them to pursue careers in STEM-related fields.

Robotics is an interdisciplinary field requiring knowledge of Engineering and Art. To build a robot one needs to have technical know-how of Electronics, Mechanics, Computer Science, Art and believe it or not, even Biology.

Robotics is a tool to learn the real world applications of the theory and concepts covered in the class. We are surrounded by gadgets, electronics and mechanical systems that are so deeply integrated into our lives that we hardly ever notice how important these systems are and how difficult it is to build them. The curriculum is aligned with the New Jersey Core Curriculum Content Standards for Technology Literacy and is designed to be engaging and rigorous. The curriculum is based on a Project-Based Learning (PBL) model. Students work cooperatively to complete their assignments and each unit culminates with a project, and presentation to assess student learning.

The Goals set forth to achieve this vision are:

GOAL 1: All students will be prepared to excel in the community, work place and in our global society using 21st century skills.

GOAL 2: All educators, including administrators, will attain the 21st century skills and knowledge necessary to effectively integrate educational technology in order to enable students to achieve the goals of the core curriculum content standards and experience success in a global society.

GOAL 3: Educational technology will be accessible by students, teachers and administrators and utilized for instructional and administrative purposes in all learning environments, including classrooms, library media centers, and other educational settings such as community centers and libraries.

GOAL 4: New Jersey school districts will establish and maintain the technology infrastructure necessary for all students, administrators and staff to safely access digital information on demand and to communicate virtually.

COURSE TITLE: ROBOTICS
GRADE LEVEL: 10-12
LENGTH OF COURSE: 1 SEMESTER
PREREQUISITE: NONE

Overview

The course of study combines a lab component based on the LEGO MINDSTORM NXT robot system which consists of a series of hands on building and programming problems and a research/lecture component exploring current and possible future applications of robotics. The two components will augment each other; in the lab students will learn by applying the fundamental principles of robotics; task planning, control systems, sensor control, orientation and programming. In the lecture/research portion of the course students will analyze current robotic systems in the context of these fundamental principles. Seeing how sophisticated robots are solving the problems that students are encountering in their own work will deepen their appreciation and understanding of the technical complexities involved in these systems. The class will also be discussing the impact of robotic technologies on society and inventing and envisioning new applications of robotics.

Lecture component.

- 1) What is a robot?
 - a) Working definition
 - i) Automated vs. robotic
 - ii) Remote control
 - iii) autonomus
 - b) History of robots
 - i) Automations
 - ii) Automation
 - c) Popular perception of robots
 - i) Science fiction
 - ii) Androids
 - d) Impact of robotics on society
 - i) Displacement of workers
 - ii) Benefits of efficiencies
 - iii) Costs and benefits
- 2) Applications of robots. These topics will be assigned as research projects for students. They will create presentations to the class. Fundamental to the presentations will be an understanding of the specific problems that must be solved for the particular application.
 - a) Industrial/ manufacturing
 - i) Farming
 - ii) Nano manufacture
 - iii) Assembly
 - iv) Task specific: welding, painting
 - b) Medical
 - i) Surgical
 - ii) Rehabilitative
 - iii) Hospital logistics

- c) Hazardous environments
 - i) Fire fighting
 - ii) Bomb detection detonation
 - d) Transportation
 - i) Driverless cars
 - ii) Aviation: autonomous drones
 - iii) Air traffic control
 - Exploration
 - iv) Undersea
 - v) Outer space
 - e) Military
 - i) Unmanned aircraft
 - ii) Unmanned vehicles
 - iii) Smart weapons
 - f) Entertainment
 - i) Animatronics/ special effects
 - ii) toys
 - g) Intelligent home
 - i) Cleaning
 - ii) Serving /cooking
 - h) Retail,
 - i) order fulfillment
 - i) Any other application that fits the class defined definition of a robot that a student suggests
- 3) Invention component. Students will be asked to think of a smart product and develop it
- a) The future of computing is in making products that utilize computing power to make them function in new and unique ways
 - b) Students will be asked to create sketches and if they have CAD skill create a model of device

Lab component

The curriculum for the Lab component of the class will be based on the ROBOTC Curriculum for TETRIX from the Carnegie Melon Robotics Academy. (2009, Tetrix)

Students will work on a series of increasingly complicated tasks with instructions coming from the video files, as well as printed materials. The course of study is a semester in duration and quite detailed. It is designed for both the LEGO MINDSTORM and TETRIX building systems. The LEGO system is a less complicated building system and the one this introductory class will use. The TETRIX system can be applied to more advanced class offerings. As the class evolves this curriculum will be modified and refined to meet the needs of CHS students.

Below is a summary of the sequence of the topics of study

- 1) Intro to Robotic Lab overview, definitions of engineering, programming, systems and project management
- 2) Class Procedures, engineering notebook,
- 3) Intro to NXT hardware
- 4) Intro to ROBOTC Software
- 5) Intro to Programming
- 6) Movement
- 7) Sensors
 - a) Touch Sensors
 - b) Ultra sonic Sensors
 - c) Encoders
 - d) Light Sensors
 - e) Line tracking
 - f) Sound Sensors
 - g) Automatic Threshold Calculations
 - h) Variables and Functions
 - i) Debugging
- 8) Remote Control

Core Curricula Standards

A detailed description of how the robotic curriculum aligns with national science, technology, engineering and mathematics standards can be found on pgs 75 – 85 of the document Robotic TETERIX Curriculum. PDF.

Writing an Analytical Paragraph	<p>Paragraph includes:</p> <ul style="list-style-type: none"> A topic statement accurately presenting information on probability. A detailed explanation of how the results of the trial compare with probability calculations. A concluding statement thoroughly summarizing results of the experiment. 	<p>Paragraph includes:</p> <ul style="list-style-type: none"> A topic statement accurately presenting information on probability. An explanation of how the results of the trial compare with probability calculations. A concluding statement summarizing results of the experiment. 	<p>Paragraph includes:</p> <ul style="list-style-type: none"> A topic statement presenting some information on probability. Some explanation of how the results of the trial compare with probability calculations. A concluding statement summarizing some results of the experiment. 	<p>Paragraph includes:</p> <ul style="list-style-type: none"> A topic statement that does not present information on probability. Little explanation of how the results of the trial compare with probability calculations. A concluding statement that does not summarize results of the experiment.

Rubrics for Engineering Journal Assessment

The Engineering Journal

The Engineering Journal is a highly recommended organizational method for the instructor to keep track of each group's work throughout the multi-week project. It consists of a folder or binder for each individual in the class, which contains the entirety of that student's work for the project. Consolidating each student's work in a single place allows for easy collection of assignments, and gives students responsibility for keeping his or her own material organized.

This gives the instructor the option of collecting students' journals to grade when assignments are due (and even when they're not).

Each student's Engineering Journal contains:

- Class handouts
- Daily logs and notes
- All completed and returned assignments
- Final (turned-in) version of any individual assignments that are due

All material should be kept in chronological order

Alternatively, you may choose to have only one journal per group, or have every student keep a copy of both individual and group assignments. The Engineering Journal is your tool for efficient assessment – customize the requirements to fit the needs of your classroom.

Assessment

- The Journal itself should be graded based on completeness and organization
 - A complete journal should include:
 - All class handouts, including syllabus and assignment sheets
 - All teacher-assigned work (homework, quizzes, etc.)
 - Daily logs, one per day of independent work
 - All major project deliverables (proposal, etc. – group journal keeper only)
 - Group meeting notes (group journal keeper only)
 - All documents in the journal should be organized by date
- Students should be responsible for lost, damaged, or poorly kept Journals
 - Points should be deducted for journals that are:
 - Lost (no credit for assignments that are lost!)
 - Damaged or sloppy (unprofessional!)
- When requested, students should hand in their journals
 - This is the preferred method for collecting work on days assignments are due
 - Penalties apply for groups or individuals who are not prepared
- Journal contents should be graded and returned in the journal
 - Assignments should be graded according to their own rubrics
 - Quizzes and journal hand-ins can be done together for convenience
- Notes and logs are a student's evidence of work done on a daily basis
 - Self- and peer-reported student records are how work habits are tracked
 - Teamwork
 - Effective use of time
 - Good planning and preparation

Rubrics for External Design Review

	(4) Advanced - A	(3) Proficient - B	(2) Basic - C	(1) Below Basic - D or E
Timeliness (10%)	<ul style="list-style-type: none"> • Prototype is fully functional at the time of review • Group is present and ready to begin on time 	<ul style="list-style-type: none"> • Prototype is semi-functional (has at least one working component) at the time of review • Group is present and ready to begin on time 	<ul style="list-style-type: none"> • Prototype is together, but not functional at the time of review • Group is present but not ready to present 	<ul style="list-style-type: none"> • Prototype is not built or functional at time of review • Not all group members are present, and group is not ready
Presentation (15%)	<ul style="list-style-type: none"> • Discussion remains professional in tone and direction • Discussion proceeds efficiently due to understanding and articulation of the groups ideas and design • Group is able to focus on relevant aspects of the robot design 	<ul style="list-style-type: none"> • Discussion remains professional in tone and direction • For the most part discussion proceeds efficiently • Group may not focus on relevant aspects of design, but does articulate important issues 	<ul style="list-style-type: none"> • Discussion does not have a professional tone or manner • Discussion does not stay on topic • Students may articulate some ideas of the project, but do not focus on main aspects of robot design 	<ul style="list-style-type: none"> • Little discussion occurs during the presentation • Students show lack of understanding of group ideas and design of robot • Group does not focus discussion
Project Management (30%)	<ul style="list-style-type: none"> • Development is in line with timeline submitted with proposal • Group member roles and responsibilities are defined and adhered to • Schedule for future development is practical and workable 	<ul style="list-style-type: none"> • Development is mostly in line with timeline submitted with proposal • Group members have roles and responsibilities which were mostly adhered to • Schedule for future development is present and likely practical and workable 	<ul style="list-style-type: none"> • Group member do not abide by timeline that was submitted with proposal • Group members do not adhere to clearly defined set of roles and responsibilities • Future development is present but may not be in schedule or practical and workable 	<ul style="list-style-type: none"> • Timeline is not submitted, or timeline is disregarded during development process • Group members do not clearly define roles • No schedule for future development is created

Rubrics for External Design Review

Progress (30%)	<ul style="list-style-type: none"> Project shows a clear progression beyond what was available at the time of proposal Every team member has effectively contributed to development Decisions show evidence of a thoughtful decision-making process Group has given appropriate consideration to all aspects of development, including mechanics, programming, and testing 	<ul style="list-style-type: none"> Project has progressed from what was available at time of proposal Most team members have effectively contributed to development Most decisions show evidence of use of a thoughtful decision-making process Group has spent some time considering all aspects of development 	<ul style="list-style-type: none"> Project has made only fair progression beyond what was available at the time of proposal Few team members have effectively contributed to development Decisions were made without using a decision-making process Group has spend little time considering all aspects of development 	<ul style="list-style-type: none"> Project has not progressed from time of proposal Little contribution from any team member No clear decisions made Group did not consider all aspects of development
Future Plans (15%)	<ul style="list-style-type: none"> Group can describe what aspects of design will be worked on next Groups has prioritized remaining tasks to ensure project will be completed on time 	<ul style="list-style-type: none"> Groups can give overall ideas of what future aspects of design will look like Group has prioritized the ideas they have come up with for future design 	<ul style="list-style-type: none"> Groups have very little idea about future aspects of design Group can provide a sketch of a timeline for future ideas 	<ul style="list-style-type: none"> Group has not thought about future aspects of design Group has no timeline to get future tasks done

Rubrics for Internal Design Review

	(4) Advanced - A	(3) Proficient - B	(2) Basic - C	(1) Below Basic - D or E
Timeliness (10%)	<ul style="list-style-type: none"> Design Candidate Sheets are completed on time for each design Design Assessment Criteria sheet is completed on time Group is present and ready to begin on time 	<ul style="list-style-type: none"> Design Candidate Sheets are complete but not on time Design Assessment Criteria sheet is completed but not on time Group is present and read to begin on time 	<ul style="list-style-type: none"> Most Design Candidate Sheets are complete Design Assessment Criteria sheet is mostly complete Group is present 	<ul style="list-style-type: none"> Design Candidate Sheets are not completed Design Assessment Criteria sheet is not completed Group is not present
Discussion (30%)	<ul style="list-style-type: none"> Group follows good meeting and teamwork procedures Discussion remains professional in tone and direction Discussion proceeds efficiently Group is able to focus on the relevant aspects of the robot designs 	<ul style="list-style-type: none"> Group follows decent meeting and teamwork procedures Discussion remains professional in tone and direction For the most part discussion proceeds efficiently For the most part group focuses on relevant aspect of robot designs 	<ul style="list-style-type: none"> Group follows few meeting and teamwork procedures Discussion does not have a professional tone or manner Discussion does not proceed efficiently Group rarely focuses on relevant aspects of robot design 	<ul style="list-style-type: none"> Group does not work as a team Little discussion occurs Discussion does not stay on topic Group does not focus on relevant aspects of robot design

Rubrics for Internal Design Review

(Cont.)	(4) Advanced - A	(3) Proficient - B	(2) Basic - C	(1) Below Basic - D or E
Problem Understanding (40%)	<ul style="list-style-type: none"> Design Assessment Criteria are appropriate Discussion indicates that all team members are familiar with the problem Discussion indicates that all team members understand the needs of the solution Candidate designs are oriented toward solving the problem Candidate designs show evidence of thought out design including mechanics, programming, and testing 	<ul style="list-style-type: none"> Design Assessment Criteria are mostly appropriate Discussion indicates that most team members are familiar with the problem Discussion indicates that most team members understand the needs of the solution Candidate designs are mostly oriented towards solving the problem Candidate designs mostly show evidence of thought out designs 	<ul style="list-style-type: none"> Design Assessment Criteria are not very appropriate Discussion indicates that a few team members are familiar with the problem Discussion indicates that a few team members understand the needs of the solution Candidate designs do not really try to solve the problem Candidate designs do not show a thought out design 	<ul style="list-style-type: none"> Design Assessment Criteria do not exist Little discussion takes place Candidate designs do not exist
Consensus (20%)	<ul style="list-style-type: none"> Group members avoid unnecessary "attachment" to their designs that gets in the way of productive discussion All group member are able to reach consensus 	<ul style="list-style-type: none"> Group members avoid unnecessary "attachment" to their designs that gets in the way of productive discussion Most group members are able to reach a consensus Group is present and ready to begin on time 	<ul style="list-style-type: none"> Group member must keep pieces of their original design which may temporarily halt productive discussion Few group members reach consensus 	<ul style="list-style-type: none"> Group members feel that their design is the only design Group members never reach consensus

Rubrics for Presentations

	(4) Advanced - A	(3) Proficient - B	(2) Basic - C	(1) Below Basic - D or E
Use of Multimedia Technology	Excellent use of multimedia technology. <ul style="list-style-type: none"> • The presentation was eye appealing. • The pictures were clear. • The sequence of the presentation was well thought out. • Presentation was organized, • Speakers were clear and used proper terminology. • Complete 	Student demonstrated they knew how to use multimedia technology. <ul style="list-style-type: none"> • The presentation was eye appealing. • The pictures were clear. • The sequence of the presentation was well thought out. • Complete 	Multimedia technology use needs work. <ul style="list-style-type: none"> • The use of multimedia technology was a distraction rather than help. • Incomplete 	Multimedia technology didn't support topic. <ul style="list-style-type: none"> • Pictures were not clear and didn't seem to have a purpose. • Incomplete
Content Analysis	Content was excellent. <ul style="list-style-type: none"> • Presentation was organized. • Project was fully described. • I learned something when I listened to the presentation. • Presentation enjoyable to watch. 	Content was good. <ul style="list-style-type: none"> • Presentation was organized. • Presentation was organized but needed more practice to be excellent. 	Content of presentation lacked clarity. <ul style="list-style-type: none"> • Presentation lacked organization and didn't have a unified theme. • Presenters didn't use proper terminology. 	Content of presentation lacked clarity. <ul style="list-style-type: none"> • Presentation lacked organization and didn't have a unified theme. • Presenters didn't use proper terminology.

Rubrics for Project Proposal Assessment

	(4) Advanced - A	(3) Proficient - B	(2) Basic - C	(1) Below Basic - D or E
Timeliness (10%)	<ul style="list-style-type: none"> All required elements are produced on time 	<ul style="list-style-type: none"> Most required elements are produced on time 	<ul style="list-style-type: none"> Few required elements are produced on time 	<ul style="list-style-type: none"> Required elements are not turned in
Presentation (20%)	<ul style="list-style-type: none"> Proposal is well written with no grammatical or spelling errors Proposal has been reviewed at least once All required elements are included Timelines and charts are written clearly, with no unnecessary marks or cross-outs 	<ul style="list-style-type: none"> Proposal is well written with few grammatical or spelling errors Proposal has been reviewed at least once Most required elements are included Timelines and charts are written clearly with few unnecessary marks or cross-outs 	<ul style="list-style-type: none"> Proposal is fairly well written with many grammatical or spelling errors Proposal has never been reviewed Most required elements are included Timelines and charts are written clearly with many unnecessary marks and cross-outs 	<ul style="list-style-type: none"> Proposal is not well written and has many grammatical or spelling errors Proposal has never been reviewed Few required elements are included Timelines and charts are not written clearly with many unnecessary marks and cross-outs
Practicality (30%)	<ul style="list-style-type: none"> Proposed solution demonstrates understanding of real-world constraints (i.e. laws of physics, time) Timeline specifies due dates for required deliverables Materials list is reasonable, given resources Proposal clearly links problem to proposed solution 	<ul style="list-style-type: none"> Proposed solution demonstrates a fair understanding of real-world constraints (i.e. laws of physics, time) Timeline specifies most due dates for required deliverables Materials list is mostly reasonable, given resources The proposal mostly links problem to the proposed solution 	<ul style="list-style-type: none"> Proposed solution demonstrates a poor understanding of real-world constraints (i.e. laws of physics, time) Timeline specifies few due dates for required deliverables Materials list is not reasonable, given resources Very little connection made between the proposed solution and the problem 	<ul style="list-style-type: none"> No proposed solution is given No timeline indicated Materials list is not reasonable No connection made between the proposed solution and the problem

Rubrics for Project Proposal Assessment

(Cont.)	(4) Advanced - A	(3) Proficient - B	(2) Basic - C	(1) Below Basic - D or E
Problem Understanding	<ul style="list-style-type: none"> Proposal demonstrates clear understanding of problem Shows consideration for need and potential users of product 	<ul style="list-style-type: none"> Proposal shows a good deal of understanding of problem Shows a good deal of consideration for need and potential of users of product 	<ul style="list-style-type: none"> Proposal shows little understanding of problem Shows little consideration for need and potential of users of product 	<ul style="list-style-type: none"> Proposal demonstrates no understanding of problem Shows no consideration for need and potential users of product
Teamwork (10%)	<ul style="list-style-type: none"> Team has defined appropriate roles/responsibilities for all members 	<ul style="list-style-type: none"> Most of the team has defined roles/responsibilities 	<ul style="list-style-type: none"> Few members of the team have defined roles/responsibilities 	<ul style="list-style-type: none"> No roles/responsibilities were defined for group members

Rubrics for Work Habits Evaluation

Student Name _____ Date _____

Course Title _____ Grading Period _____

10 Advanced		9 Proficient	8 Basic	7-0 Unacceptable		
					Self	Teacher
1	Gives full attention to instructions and follows directions.					
2	Comes prepared and works the entire class period.					
3	Works well with minimal supervision.					
4	Works up to potential, shows maximum effort.					
5	Works cooperatively as a member of a group.					
6	Makes effective use of time and/or materials.					
7	Demonstrates initiative and motivation.					
8	Has a cooperative, positive attitude.					
9	Is on time for class.					
10	Participates daily in the cleanup program.					
	Work Habits Point Total					

Rubrics for Workplace Competencies Evaluation

Student Name _____ Date _____

Course Title _____ Grading Period _____

Calculate a score based on the following workplace competencies

1	Consistently demonstrates a positive attitude Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
2	Cooperates all of the time Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
3	Communicates well Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
4	Honest Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
5	Dependable Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
6	Recognizes problems and finds acceptable solutions Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
7	Concentrates Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
8	Produces quality work Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
9	Makes smart decisions Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
10	Always attends Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
12	Always punctual Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
13	Follows directions Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
14	Reads, writes, and calculates well Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
15	Shows leadership Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
16	Practice good grooming and dresses appropriately Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
17	Meets deadlines while producing quality Always (7) - Usually (5) - Sometimes (3) - Seldom (1) - Never (0)	
	Work Habits Point Total	

Rubrics for Robotics Class Writing

All students in robotics class will be using the writing process when completing assignments for class. Brainstorm your topic, outline what you plan to write about, then write your essay.

For full credit you will need to turn in proof of the following:

1. Brainstorm worksheet: A sheet of paper that includes all ideas generated during the brainstorming process. Include everything that you think of about your topic when brainstorming.
2. An outline of how you you plan to present your topic. Outline the information that you have in your brainstorming sheet. What will you talk about first, second, third, how will you support what you are writing about? Put it on the back of your brainstorming sheet.
3. 1st draft of your paper: Double-space your paper so that it will be easier to edit. You can edit on the same copy that you turn in. Just make sure that it can be read.

You will be evaluated on the following:

- One point for your brainstorm worksheet.
- One point for your outline.
- One point for the accuracy of the information being presented.
- One point for how well your paper reads. Is it choppy? Does the information you wrote clearly support what you are trying to say? Did you proofread your paper for errors?
- One point for spelling.

5pts A 4pts B 3pts C 2pts D

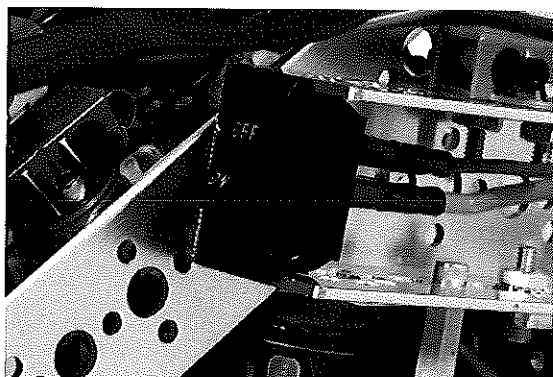

APPENDIX B
SAFETY GUIDELINES

TETRIX™ Hardware

Safety

INDEX

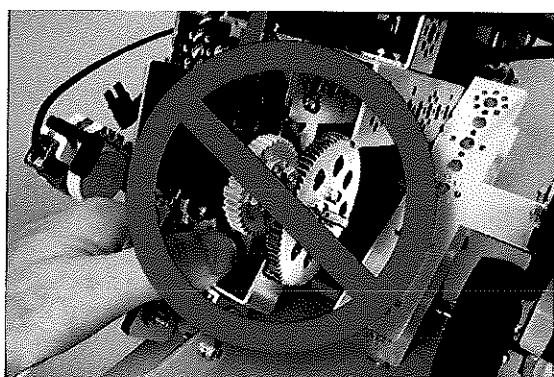

1. Personal Safety
2. Mechanical Safety
3. Electrical Safety

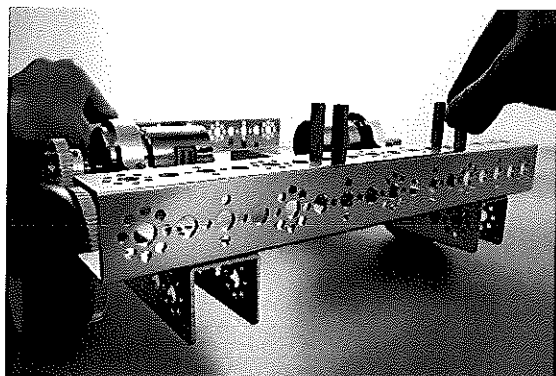

1. Personal Safety

The TETRIX DC motors have a very powerful torque rating of 300 oz/inches. Proper care must be taken to protect you as well as your assembly.

The robot should ***always*** be powered down before operating or working with any section of it.

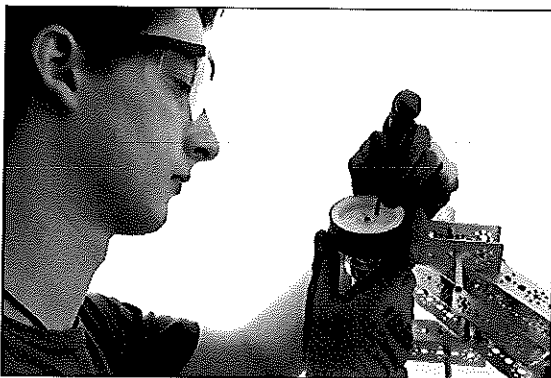

Keep hair, clothing, and all parts of your body away from the moving components on the robot while it is turned on. This includes (but is not limited to) any motors, wheels and gears that could start spinning.

Only work in clean environments free of both clutter and moisture.

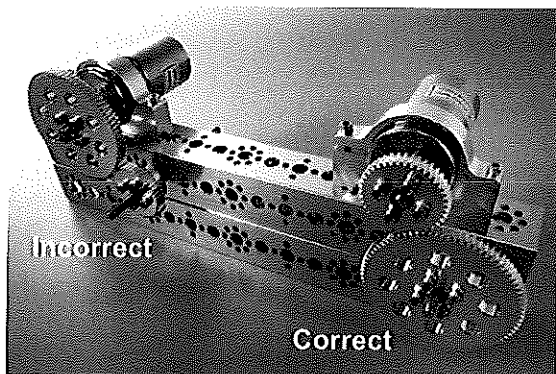

TETRIX™ Hardware

When working on metal robots, wear safety gloves and goggles to protect the skin and eyes.

Use extra caution when cutting metal. Only do so under direct supervision and always cut away from your body (not toward). After cutting, be sure to file, sand down or tape off any rough or jagged edges.

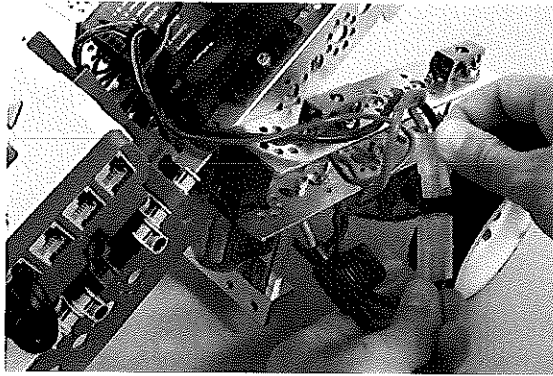

2. Mechanical Safety

Never drive a smaller gear with a larger gear. Doing so risks exceeding the the DC motor's torque rating and damaging the inner gearbox (burning out the motor).

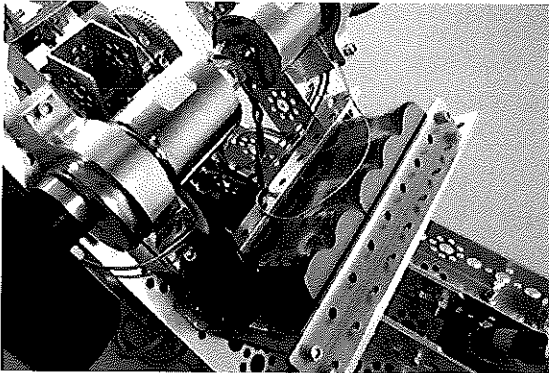

When using two or more servo motors together, the centers must be identified and aligned so the motors will run on a common axis. If this is not done, the servo's motion may be hindered and moving parts damaged by contact with mis-aligned components.

TETRIX™ Hardware

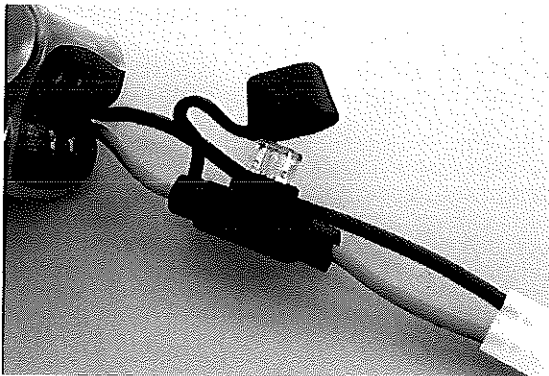

3. Electrical Safety

Make sure the power supply is disconnected when wiring the DC Motor or Servo Controllers.

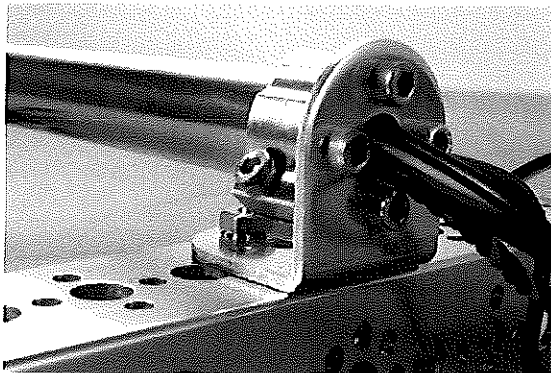

The battery should be positioned so it will not rub against sharp edges. A damaged, leaking battery is a safety hazard.

Never bypass the battery's inline fuse. Doing so will damage your robot's electrical components.

To extend the life of the battery, don't allow it to stay connected to the charger for extended periods of time.

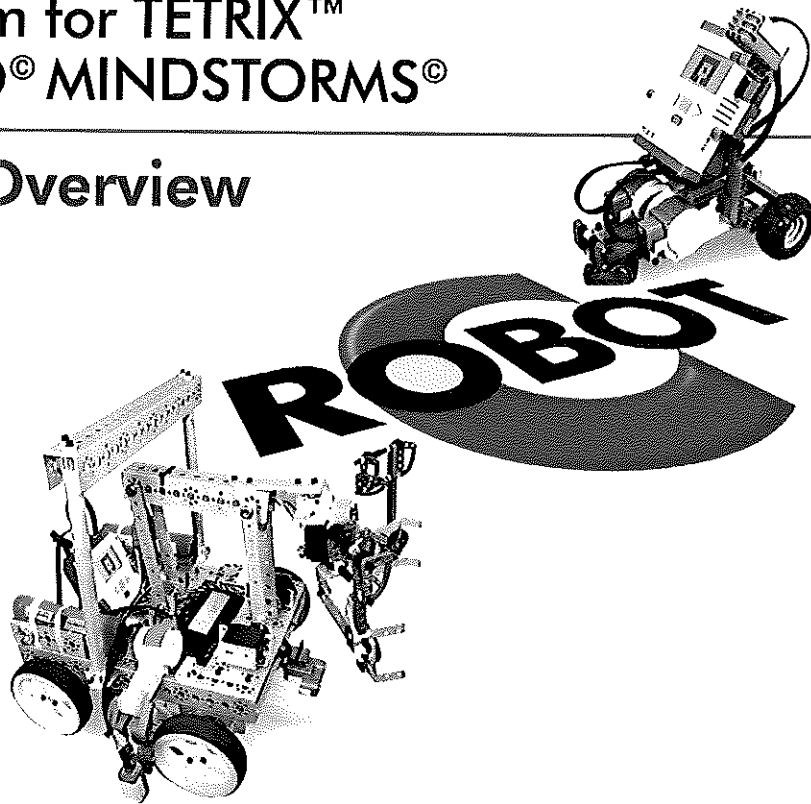

Avoid running wires along 'pinch points'. Sharp metal pieces and gears can damage the wires and their insulation, causing them to break or be exposed.

When possible, run wires through metal tubing and wire-tie them to structural components.

Why Robotics/STEM Education

We can't predict what the hot new technology will be in five years, but we can confidently predict that it will include computer programming, electronic embedded systems, engineering design, and mathematics. If you believe these things, then you need to know that robotics has the ability to teach these concepts. At the same time, robotics teaches 21st century skill sets like time management, resource allocation, teamwork, problem solving, and communications.

Think about this...

- Approximately 98% of all the 32-bit microprocessors currently in use worldwide are used in embedded systems; in other words they are being used in robotic smart technologies.
- By the year 2010, it is forecasted that 90% of the overall program code developed will be for embedded computing systems; to innovate and compete globally we will need more people that know how to program.
- Robotics Technology is a hundred billion dollar emerging industry that has moved from being an industry that could potentially employ thousands of people to an *integral part of all industries*. Robotics will impact the economy the same way that mass production impacted the industrial revolution and the computer impacted the information age.
- Science and Engineering (S&E) occupations are projected to grow by 26% from 2010 to 2020, twice as fast as the overall job market during that period (S&E 2008) yet we have fewer students pursuing S&E careers.

The Teaching ROBOTC for TETRIX Curriculum

If you are reading this, then you are probably considering teaching using a combination of the NXT, TETRIX, and ROBOTC. I understand the dilemma that you are facing, I taught in the Pittsburgh Public School System for 27 years before coming to Carnegie Mellon. You have a limited budget, you have a thousand things to do every day that don't involve teaching, and then you also teach five or six sections of students. (Sometimes with multiple preps!) This curriculum is designed for a teacher with no programming background that is interested in teaching programming and engineering. This curriculum also supports a teacher that knows how to program, but has students of various skill levels and wants to allow them to move at their own pace. The teaching materials that we've developed use a high level of multimedia and have been tested with hundreds of students; they work. ROBOTC is the best programming software available for use with TETRIX and the NXT if you consider the percentage of teams that use ROBOTC software and made it to the finals of the FTC competition. You have one of the hardest jobs in the world; you teach. This training tool will make it easier.

Math is the language of science, engineering and technology

Many teachers see robotics as a way to teach STEM education. We've seen that robotics *does* provide unique opportunities for teachers to place engineering design, scientific process, technological literacy and mathematics in contexts that students find engaging and understand. Across the nation, many schools and community-based organizations are using robotics to address STEM competencies. Yet, our research is finding that many teachers miss key STEM "teaching moments" that robotics enables. Often, robotics teachers will allow students to be haphazard in their design process and avoid mathematics when possible (e.g., using guess-and-check strategies). This methodology leads to weak solutions and reduces student learning.

At the Robotics Academy we believe that:

- Math is the language of STEM and if you can't do math, then you won't be able to compete for a STEM job.
- Mathematics needs to be carefully thought out by the teacher and foregrounded for the student. The focus of the math instruction must be centered on addressing specific mathematics concepts (not general) and the mathematics in the lesson must be made explicit not implicit.
- For students' STEM understanding to move beyond parroting the teacher's words, ideas, and solutions, and to develop deep understanding, students need the opportunity to struggle with the problem, be able to defend their decisions, and explain their answer in their own words.

The moral of the story is "require your students to do the math." To learn more about teaching with robotics visit our web site. Carnegie Mellon is committed to helping teachers teach robotics. If there is something that we can help you with, then please contact us. If you see opportunities to make our teaching products stronger, then please contact us.

Have a great year.

Robin Shoop,
Director, Carnegie Mellon Robotics Academy

ROBOTC Curriculum for TETRIS and LEGO MINDSTORMS

Teaching is a craft and every teacher does it differently. This curriculum is designed to teach “engineering process” and “programming”. The Robotics Academy has developed this curriculum to help teachers to teach and students to learn those competencies. The Robotics Academy is committed to helping teachers use robotics to teach science, technology, engineering, and mathematics. Teachers can find additional TETRIS resources to teach robotics and engineering at our TETRIS site, which is continually upgraded by the Robotics Academy, go to www.tetrixteacher.com.

The scope and sequence below is designed to help you to quickly find resources to teach your class. The number of days at the right will depend on the number of challenges and labs that your students complete.

Welcome to Robotics Class.....1-2 days

- What are the goals of this class?
- What is the definition of a robot? - SPA handout - page 37
- What is the definition of engineering? - Videos and handouts - page 10 & 11
- What is the definition of programming? - Videos and handouts - page 15
- What is the definition of a system?
- What does it mean to manage a project? - Videos and handouts - page 10

Class organization rules.....1-2 days

- Grading/Rubrics for Evaluation – page 13
- Lab Procedures – pages 13 & 14
- Keeping an Engineering Journal – page 10

Safety.....2-3 days and then ongoing

- General Safety handout – page 8
- Safety Checklist handout – page 9
- Safety Quiz – page 9

Introduction to the NXT Hardware.....2-3 days then ongoing

- The NXT Controller – page 18
- NXT Sensors – page 17
- NXT Parts Identification – page 17
- Building your first robot – page 21

Introduction to ROBOTC Software.....1 days then ongoing

- Download Firmware video – page 21
- Download Your First Program lesson video – page 21
- Introduction to ROBOTC 2.0 Software lesson video – page 15
- Programming Quizzes and handouts – page 22

Introduction to Programming.....1-2 days

- Thinking About Programming lesson video – page 15
- ROBOTC Programming Syntax lesson video – page 16
- Behaviors/pseudocode handout – page 15
- Whitespace/Comments/ reserved words handouts – page 16

Movement – NXT Forward/Backward/Turning.....8-10 days

- Labyrinth Challenge – page 27
- Moving Forward lesson videos and handouts – pages 28 & 29
- Motor Power Engineering Lab – page 30
- Speed and Direction lesson videos and handouts – pages 29 & 30
- Turning Engineering Lab – page 30
- PID videos and handout – page 31
- Synchronized Motors lesson video and handout – page 32
- Synchronized Motors Engineering Lab – page 32
- Introduction to Encoders lesson video and handouts – page 32

ROBOTC Curriculum for TETRIX and LEGO MINDSTORMS

Sensing.....	20-25 days
The Obstacle Course Programming Challenge – page 34	
Touch Sensor – pages 35 through 37.....	3-5 days
While Loop lesson video – page 36	
While Loop reference handout – page 37	
Sense-Plan-Act Algorithm reference handout – page 37	
Boolean Logic lesson videos and handouts – pages 36 & 37	
Touch Sensor Programming Challenges – page 37	
Touch Sensor Quiz – page 37	
Ultrasonic Sensor – pages 38 & 39.....	2-3 days
Ultrasonic lesson video – page 39.	
Calculating Thresholds handout – page 39	
Random Numbers reference handout – page 39	
Ultrasonic Programming Challenges – page 39	
Ultrasonic Sensor Quiz – page 39	
Encoders/the LEGO Smart Motors – pages 40 & 41.....	3-5 days
Encoder lesson videos – page 41	
Encoder Engineering Lab – page 41	
Motor Encoder reference handout – page 41	
Encoder programming Challenge – page 41	
Light Sensor – pages 42 & 43.....	3-5 days
Light Sensor lesson videos – page 43	
Light Sensor Challenges – page 43	
Light Sensor Quiz – page 43	
Light Sensor/Line Tracking – pages 44 through 46.....	3-5 days
Line Tracking lesson videos – page 45	
Timer video – page 45	
If-else Statement reference handout – page 46	
Switch Case reference handout – page 46	
Line Tracking Programming Challenges – page 46	
Line Tracking Quiz – page 46	
Sound Sensor – pages 47.....	2-3 days
Sound Sensor lesson videos – page 47	
Sound Sensor reference handout – page 47	
Sound Sensor Quiz – page 47	
Variables and Functions – page 48.....	10-15 days
The Warehouse Programming Challenge – page 49	
Automatic Threshold Calculations – pages 50 through 52.....	3-5 days
Automatic Threshold lesson videos – page 51	
Values and Variables lesson videos – page 51	
Variables and the Debugger lesson video – page 51	
Variables reference handout – page 52	
Text to Display lab – page 52	
Automatic Calculations Programming Challenge – page 52	
Automatic Thresholds Quiz – page 52	
Variables and Functions/Counting – pages 53 through 55.....	3-5 days
Line Counting lesson videos – page 54	
Quick Tap Programming Challenges – page 55	
Line Counting Quiz – page 55	

ROBOTC Curriculum for TETRIS and LEGO MINDSTORMS

Variables and Functions/Patterns of Behaviors- pages 56 through 58.....3-5 days

Variables and Functions lesson videos – page 57

Global Variables reference handout – page 58

Functions reference handout – page 58

Functions Programming Challenges – page 58

Functions Programming Quiz – page 58

Debugging – page 59.....2 days

Debugging lesson videos – page 59

Remote Control – page 60.....4-10 days

Remote Control Soccer Programming Challenge – page 61

Remote Control Basics – pages 62 & 63

Remote Control lesson videos – page 63

Remote Control reference handout – page 63

Remote Control Buttons lab – page 63

Remote Control Programming Challenge – page 63

Using Bluetooth - pages 64 & 65

Using Bluetooth lesson videos – page 65

USB Bluetooth Adaptor reference handout page 65

TETRIS.....40 – 55 days

TETRIS Hardware – page 19 & 20.....2-4 days

Safety Working with TETRIS – page 19

TETRIS reference handouts – page 20

Building your first robot – page 22

TETRIS Testbed – page 23.....2-4 days

TETRIS TETRIS Movement – pages 66 through 68.....4-7 days

TETRIS Movement lesson videos – page 67

TETRIS Drive Straight Lab – page 68

TETRIS Engineering Labs – page 68

TETRIS Sensing – pages 69 through 71.....10 – 15 days

TETRIS Sensing lesson videos – page 70

IR Sensor Videos – page 70

TETRIS Programming Challenges – page 71

TETRIS Engineering Challenges.....30 - 45 days

Robot Mining Challenge – pages 72 through 74

Robot Mine Removal Challenge – page 75

National Science Education Standards - pages 76 through 79

National Council of Teachers of Mathematics - pages 80 & 81

International Technology Education Association - pages 82 & 83

Reading, Writing, Listening, and Presenting - pages 84 & 85

Additional Robotics Academy LEGO Robotics Resources - pages 86 & 87

Getting Started

The ROBOTC Curriculum for TETRIX and LEGO MINDSTORMS is a comprehensive guide that teaches how to program the NXT Mindstorms and TETRIX hardware systems as it helps student develop engineering competencies.

ROBOTC[®] Curriculum for TETRIX[™] and LEGO[®] MINDSTORMS[®]

This multimedia curriculum features lessons for both the TETRIX and LEGO MINDSTORMS robotics systems, which each use the NXT Intelligent Brick Controller. It includes in-depth programming lessons for ROBOTC, multi-faceted engineering challenges, step-by-step videos, robotics support material, educational resources, and more.

How to Use This Product Video

Click to view an introductory video that will get you started with this CD-Rom.

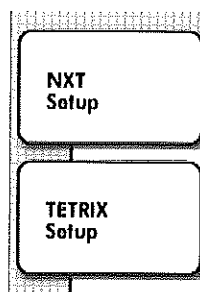

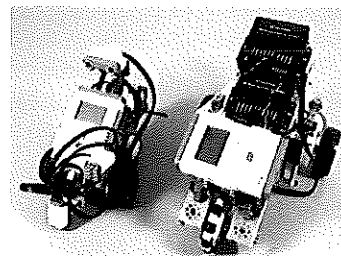

ROBOTC[®] Curriculum for TETRIX[™] & LEGO[®] MINDSTORMS[®]

Copyright 2009 CMU Robotics Academy

Scaffolded Approach to Learning

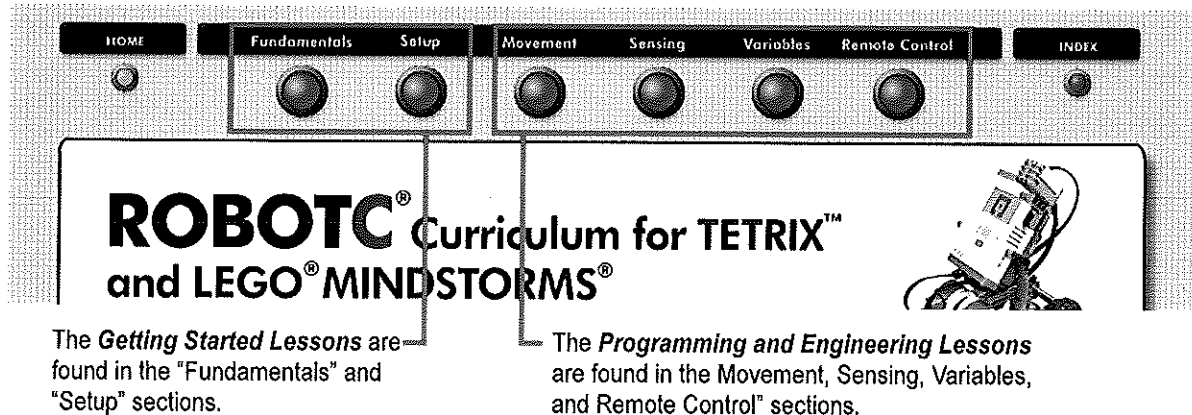

This curriculum uses a scaffolded approach to teach students how to program the NXT-based TETRIX system. Students begin by learning to use, troubleshoot, and program the less complicated LEGO MINDSTORMS NXT robot system before they begin to work with the more complex TETRIX robot system. Once students understand how to program and troubleshoot the NXT system, programming and troubleshooting the TETRIX system is easier.

All lessons are color coded. The NXT lessons are gray and the TETRIX lessons are blue. Students should complete all of the NXT lessons before they begin the TETRIX lessons

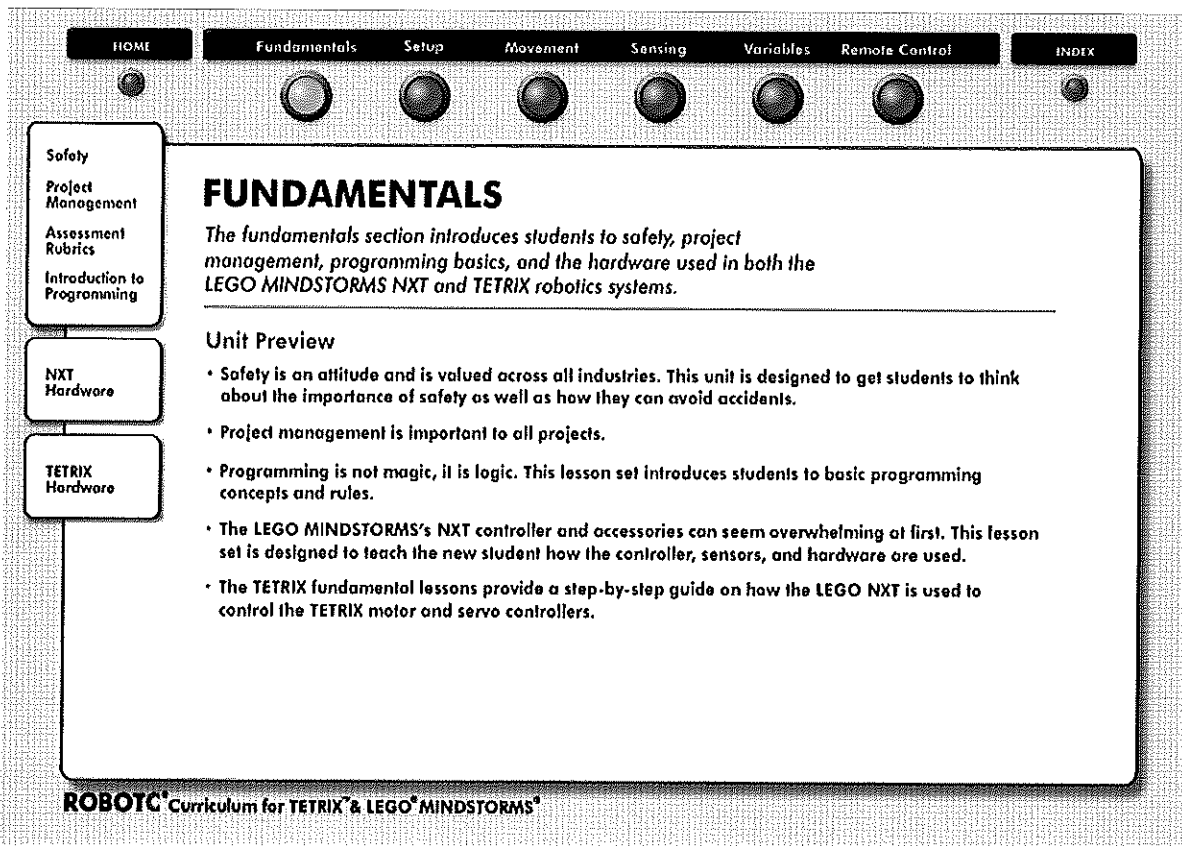

Getting Started/Fundamentals

The curriculum is divided into two sections: "Getting Started" and "Programming and Engineering."

The screenshot shows the website's navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. The main content area features the title "ROBOTC Curriculum for TETRIX and LEGO MINDSTORMS" and an image of a robot. Two text boxes explain the curriculum structure: "The *Getting Started Lessons* are found in the 'Fundamentals' and 'Setup' sections." and "The *Programming and Engineering Lessons* are found in the Movement, Sensing, Variables, and Remote Control" sections."

The Fundamentals Unit

The screenshot shows the "FUNDAMENTALS" page. The navigation bar is the same as the previous page. On the left, a sidebar lists: Safety, Project Management, Assessment Rubrics, Introduction to Programming, NXT Hardware, and TETRIX Hardware. The main content area has the title "FUNDAMENTALS" and a description: "The fundamentals section introduces students to safety, project management, programming basics, and the hardware used in both the LEGO MINDSTORMS NXT and TETRIX robotics systems." Below this is a "Unit Preview" section with a bulleted list of topics.

FUNDAMENTALS

The fundamentals section introduces students to safety, project management, programming basics, and the hardware used in both the LEGO MINDSTORMS NXT and TETRIX robotics systems.

Unit Preview

- Safety is an attitude and is valued across all industries. This unit is designed to get students to think about the importance of safety as well as how they can avoid accidents.
- Project management is important to all projects.
- Programming is not magic, it is logic. This lesson set introduces students to basic programming concepts and rules.
- The LEGO MINDSTORMS's NXT controller and accessories can seem overwhelming at first. This lesson set is designed to teach the new student how the controller, sensors, and hardware are used.
- The TETRIX fundamental lessons provide a step-by-step guide on how the LEGO NXT is used to control the TETRIX motor and servo controllers.

ROBOTC Curriculum for TETRIX & LEGO MINDSTORMS

The Fundamentals Unit is divided into six Lesson Sets: *Safety, Project Management, Assessment Rubrics, Introduction to Programming, NXT hardware, and TETRIX Hardware.*

Getting Started/Fundamentals/Safety

The screenshot shows the ROBOTC Curriculum website interface. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. On the left is a sidebar menu with links to Safety, Project Management, Assessment Rubrics, Introduction to Programming, NXT Hardware, and TETRIX Hardware. The main content area is titled "Safety" and contains the following text: "Safety is an 'attitude' that is valued across all industries clusters. This section of the curriculum provides resources and activities designed to instill a safe attitude in all students working with TETRIX robots." Below this text are three columns of resources, each with a document icon and a title: "Safety is an Attitude", "General Lab Safety", "Safety Checklist", "TETRIX Safety" (containing "Electrical Safety" and "Power Tools Safety"), and "Safety Tests (with answer keys)" (containing "Safety Attitude Test", "General Safety Test", "Safety Quiz", and "Robotics Lab Inspection Sheet"). At the bottom of the page, it says "ROBOTC Curriculum for TETRIX™ & LEGO® MINDSTORMS®".

Safety

Any course that involves moving parts, handling and processing materials and students requires safety training. Safety begins with the development of a safe attitude. Most accidents can be avoided if a student develops a safe and conscientious attitude. The safety lesson begins by challenging a student's general beliefs about safety and concludes with a safety inspection of the robotics lab.

Safety is an Attitude - A one page handout that defines what safety is and what safety is not, and concludes with statements that support the fact that most accidents are preventable with the development of a safe attitude.

General Lab Safety - A four page handout that spells out general safety rules, describes features of a safe classroom, safe storage, material handling, disposal of materials, tools and equipment, and ends with a list of definitions of terms that students may not know.

Safety Checklist - A three page handout that contains a safety checklist, rules to consider when you are moving things around the lab, and a one page safety poster.

Electrical Safety - A two page handout that describes safety rules when working with electricity and common causes of electrical accidents, including defective equipment, unsafe practices, and lack of electrical knowledge.

Power Tool Safety - A one page handout that sets rules and expectations for when students use power tools in the robotics lab.

The thumbnail shows the "Safety is an Attitude" handout. It has a title "Safety" at the top, followed by "Safety is an Attitude". Below this is a section "Safety is an Attitude" with a list of statements: "Safety is a habit that is developed over time", "Safety is a mindset that is developed over time", "Safety is a way of thinking that is developed over time", "Safety is a way of acting that is developed over time", "Safety is a way of feeling that is developed over time", "Safety is a way of being that is developed over time". Below this is a section "Accidents are preventable" with a list of statements: "Most accidents are preventable", "Most accidents are preventable", "Most accidents are preventable", "Most accidents are preventable", "Most accidents are preventable", "Most accidents are preventable".

Safety

General Safety Considerations

Students must be given the opportunity to learn about safety in a way that is fun and engaging. The following are some suggestions for how to do this:

1. Have students create a safety poster or video.
2. Have students create a safety song or rap.
3. Have students create a safety skit or play.
4. Have students create a safety game or activity.
5. Have students create a safety story or poem.
6. Have students create a safety drawing or painting.
7. Have students create a safety comic book.
8. Have students create a safety puppet or marionette.
9. Have students create a safety dance or song.
10. Have students create a safety poster or video.

FACTORY DESIGN

Classroom Management

Safety is a key component of any classroom. The following are some suggestions for how to manage the classroom:

1. Establish a clear set of rules and expectations.
2. Establish a consistent system of consequences.
3. Establish a positive reinforcement system.
4. Establish a clear system of communication.
5. Establish a clear system of discipline.
6. Establish a clear system of rewards.
7. Establish a clear system of feedback.
8. Establish a clear system of evaluation.
9. Establish a clear system of assessment.
10. Establish a clear system of grading.

Classroom Safety Checklist

Walkways
free of debris, liquid spills, and obstructions

Equipment
securely fastened in place

Tools
placed in their proper storage area

Desk and storage cabinets
closed after use

Desk and table tops
free of clutter, chips, or breaks

Storage shelves
heavy items arranged toward ends and on the bottom

Ladder
easily accessible

Tools, machinery, and equipment
carefully arranged for free traffic flow

Student projects
placed in proper storage at the end of the period

Flammables
stored in proper storage containers

Safety

Electrical Safety

Students should be given the opportunity to learn about electrical safety in a way that is fun and engaging. The following are some suggestions for how to do this:

1. Have students create a safety poster or video.
2. Have students create a safety song or rap.
3. Have students create a safety skit or play.
4. Have students create a safety game or activity.
5. Have students create a safety story or poem.
6. Have students create a safety drawing or painting.
7. Have students create a safety comic book.
8. Have students create a safety puppet or marionette.
9. Have students create a safety dance or song.
10. Have students create a safety poster or video.

Safety Rules for Working with Electricity

The following are some suggestions for how to work safely with electricity:

1. Always use proper safety techniques.
2. Always use proper safety equipment.
3. Always use proper safety procedures.
4. Always use proper safety protocols.
5. Always use proper safety standards.
6. Always use proper safety practices.
7. Always use proper safety methods.
8. Always use proper safety techniques.
9. Always use proper safety equipment.
10. Always use proper safety procedures.

Common Causes of Electrical Accidents

The following are some common causes of electrical accidents:

1. Overloading circuits.
2. Using damaged equipment.
3. Using improper wiring.
4. Using improper tools.
5. Using improper techniques.
6. Using improper equipment.
7. Using improper procedures.
8. Using improper protocols.
9. Using improper standards.
10. Using improper practices.

ROBOTC 4

Safety

Power Tools Safety

Students should be given the opportunity to learn about power tool safety in a way that is fun and engaging. The following are some suggestions for how to do this:

1. Have students create a safety poster or video.
2. Have students create a safety song or rap.
3. Have students create a safety skit or play.
4. Have students create a safety game or activity.
5. Have students create a safety story or poem.
6. Have students create a safety drawing or painting.
7. Have students create a safety comic book.
8. Have students create a safety puppet or marionette.
9. Have students create a safety dance or song.
10. Have students create a safety poster or video.

Safety Rules for Power Equipment

The following are some suggestions for how to work safely with power equipment:

1. Always use proper safety techniques.
2. Always use proper safety equipment.
3. Always use proper safety procedures.
4. Always use proper safety protocols.
5. Always use proper safety standards.
6. Always use proper safety practices.
7. Always use proper safety methods.
8. Always use proper safety techniques.
9. Always use proper safety equipment.
10. Always use proper safety procedures.

ROBOTC 5

Safety

Safety Attitude Test

Students should be given the opportunity to learn about safety attitude in a way that is fun and engaging. The following are some suggestions for how to do this:

1. Have students create a safety poster or video.
2. Have students create a safety song or rap.
3. Have students create a safety skit or play.
4. Have students create a safety game or activity.
5. Have students create a safety story or poem.
6. Have students create a safety drawing or painting.
7. Have students create a safety comic book.
8. Have students create a safety puppet or marionette.
9. Have students create a safety dance or song.
10. Have students create a safety poster or video.

ROBOTC Curriculum for TETRIX™ and LEGO MINDSTORMS™

ROBOTC 6

Safety

General Safety Test

Students should be given the opportunity to learn about general safety in a way that is fun and engaging. The following are some suggestions for how to do this:

1. Have students create a safety poster or video.
2. Have students create a safety song or rap.
3. Have students create a safety skit or play.
4. Have students create a safety game or activity.
5. Have students create a safety story or poem.
6. Have students create a safety drawing or painting.
7. Have students create a safety comic book.
8. Have students create a safety puppet or marionette.
9. Have students create a safety dance or song.
10. Have students create a safety poster or video.

Safety

Safety Quiz

Students should be given the opportunity to learn about safety quiz in a way that is fun and engaging. The following are some suggestions for how to do this:

1. Have students create a safety poster or video.
2. Have students create a safety song or rap.
3. Have students create a safety skit or play.
4. Have students create a safety game or activity.
5. Have students create a safety story or poem.
6. Have students create a safety drawing or painting.
7. Have students create a safety comic book.
8. Have students create a safety puppet or marionette.
9. Have students create a safety dance or song.
10. Have students create a safety poster or video.

ROBOTC Curriculum for TETRIX™ and LEGO MINDSTORMS™

Getting Started/Fundamentals/Project Management

Project Management

It doesn't matter what career you choose it will be important to be able to manage projects and apply engineering processes to solve problems. The links below contain resources that you will find helpful as you solve design problems.

Project Planning Documents

- Team Building
- Design Reviews
- Gantt Chart
- Understanding the Problem
- Organizational Matrix Ideas
- PERT Chart
- Brainstorming
- Recording Progress
- Preparing for a Competition
- Planning Your Time

Project Planning

- Project Planning
- Engineering Process
- Keeping an Engineering Journal
- Engineering Process Reference
- Engineering Definitions

ROBOTC[®] Curriculum for TETRIX[®] & LEGO[®] MINDSTORMS[®]

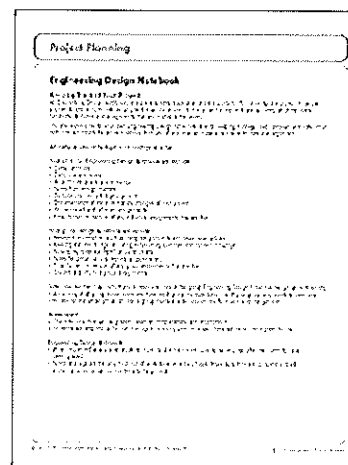

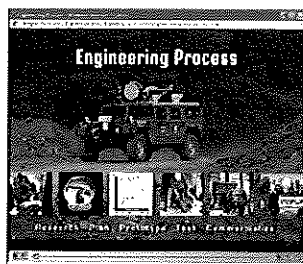

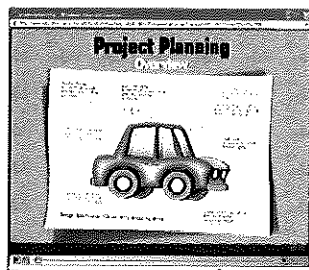

Project Management

Many schools compete in robotic competitions; other schools are using MINDSTORMS and TETRIX to teach engineering. The links on this page provide students with resources that teach how to manage projects and solve engineering design problems.

Project Planning Video - The five minute Project Planning Video uses a combination of humor and examples to describe what a well planned project looks like.

Engineering Process Video - The five minute Engineering Process Video highlights the importance of research, planning, developing prototypes, and iterative testing when solving engineering design problems.

Engineering Design Notebook - Each student is required to keep an engineering design notebook. This two page handout describes the what is kept in the notebook and what a daily log is.

Getting Started/Fundamentals/Project Management continued

Project Planning Documents

Engineering Process Reference - This three page set of handouts describes steps that engineers use to solve problems, provides a set of definitions for the word "engineering", and describes the iterative nature of design.

Team Building PDF. The Team Building Lesson Set consists of four documents that describe guidelines that teams should use for the first team meeting, general ground rules for any team meeting, things to consider when building teams, and a description of roles on a robotics team: Project Management, Programming, Engineering, Documentation and Communications.

Understanding the Problem PDF - One of the keys to solving any problem is "Understanding the Problem". This three page set of handouts consists of: Defining the Problem, Technical Research, and Creating a Design Specification.

Brainstorming PDF - Another key problem-solving step involves meetings where people brainstorm together to develop potential solutions. This three page set of handouts is broken into: a Brainstorming Primer, Things to Think About, and Brainstorming Tips. Each handout can be used individually or as part of a set.

Planning Your Time PDF - Time management is a crucial skill to develop. This four page handout uses a simple activity, planning a birthday party, to describe a critical skill set that everyone should learn: how to manage time.

Design Reviews PDF - Engineers conduct design reviews on a regular basis. This two page handout describes how to conduct weekly team design reviews, as well as preliminary and detail design reviews.

Project Planning • What is Engineering Process?

Engineering Process

1. Define problem
Specify conditions
Develop sketch
Create a plan

2. Develop solution
Brainstorm
Select a solution

3. Build and test
Build a model
Create a design
Construct and evaluate

4. Evaluate
Reflect, repeat

5. Communicate
Document your work
Write
Create a presentation

The design process is a series of steps that engineers use to solve a problem. Engineers usually use iteration to explore different ways to solve a problem.

The first step in solving a problem is to define the problem. You have to know what the problem is and what you are trying to solve before you can start to solve it. It is like a puzzle. You have to know what the puzzle is and what you are trying to solve before you can start to solve it.

The next step in solving a problem is to develop a solution. You have to think about different ways to solve the problem. You have to choose the best solution. You have to build a model of the solution. You have to test the model. You have to evaluate the model. You have to communicate the model.

The third step in solving a problem is to build and test. You have to build a model of the solution. You have to test the model. You have to evaluate the model. You have to communicate the model.

The fourth step in solving a problem is to evaluate. You have to reflect on the process. You have to repeat the process. You have to evaluate the process. You have to communicate the process.

The fifth step in solving a problem is to communicate. You have to document your work. You have to write. You have to create a presentation. You have to communicate the process.

Project Planning • Brainstorming

Brainstorming Primer

It is always difficult to get a group going at first, so you may think it is better to assign all the members of the group to work on their own projects. However, this is not the best idea. Brainstorming is a technique for getting the group to work together and generate ideas. It is reported that groups who brainstorm results working about 25% better than those who work on their own.

Choosing Type for Your Team

- A team that is too large is less likely to generate new ideas and more likely to become more complex
- A team with 4 members tends to be more successful than one with 6
- A team with 6 members is likely to be more successful
- A team with 8 members is likely to be more successful
- A team with 10 members is likely to be more successful
- A team with 12 members is likely to be more successful

Brainstorming Rules

Rules must be followed for the brainstorming process to be successful. The rules are to generate ideas that you want to use. The rules are to generate ideas that you want to use. The rules are to generate ideas that you want to use. The rules are to generate ideas that you want to use.

The Rules:

There are four rules to follow in a brainstorming session. The first rule is to generate ideas that you want to use. The second rule is to generate ideas that you want to use. The third rule is to generate ideas that you want to use. The fourth rule is to generate ideas that you want to use.

Consider Resources

It is important to consider the resources that are available to the group. The resources that are available to the group are the resources that are available to the group. The resources that are available to the group are the resources that are available to the group.

Test Multiple Solutions

It is important to test multiple solutions. The multiple solutions that are available to the group are the multiple solutions that are available to the group. The multiple solutions that are available to the group are the multiple solutions that are available to the group.

Be Flexible

It is important to be flexible. The flexibility that is available to the group is the flexibility that is available to the group. The flexibility that is available to the group is the flexibility that is available to the group.

Project Planning • Design Reviews

The Design Review

It is critical that systems users have the opportunity to participate in the design review. Communication with the users is essential to the success of the project. One of the most difficult tasks for systems administrators who have not called design reviews is to get individuals to attend. The design review is a critical time to discuss requirements and to make changes. The purpose of the design review is to get individuals to attend, discuss the requirements, and make changes. The purpose of the design review is to get individuals to attend, discuss the requirements, and make changes.

Weekly Reviews

Weekly reviews are a critical part of the project. They are a time to discuss the progress of the project and to make changes. They are a time to discuss the progress of the project and to make changes. They are a time to discuss the progress of the project and to make changes.

Advantages and Disadvantages of Design Reviews

Design reviews are a critical part of the project. They are a time to discuss the progress of the project and to make changes. They are a time to discuss the progress of the project and to make changes. They are a time to discuss the progress of the project and to make changes.

Disadvantages of the Design Review Process

Disadvantages of the design review process include the time and cost of the review. The review process can be time-consuming and costly. The review process can be time-consuming and costly. The review process can be time-consuming and costly.

Getting Started/Fundamentals/Project Management continued

Project Planning Documents

Organizational Matrix Ideas PDF - This three page handout graphically shows three methods of organizing projects.

Recording Progress PDF - The recording progress tools offer the project manager three solutions that can be used to help team members to document the team's progress toward the project goals.

Gantt Chart PDF - A Gantt chart provides a graphical illustration of a schedule to help plan, coordinate, and track specific tasks in a project. This one page handout is designed to teach students how Gantt charts work.

PERT Chart PDF - A PERT chart is a tool that graphically illustrates when parts of the project become due. The advantage of the PERT chart is that it shows which things must be completed in sequence and which things need to be completed simultaneously. This one page handout is designed to teach students how PERT charts work.

Preparing for a Competition PDF- Robotic competitions offer unique opportunities to teach students about time management, resource allocation, teamwork, and problem solving, all within a context that they find challenging but fun. The Preparing for a Competition handout is designed to support robotics teams as they plan for the competition.

Getting Started/Fundamentals/Assessment Rubrics

Assessment Rubrics

Timely assessment is paramount in today's educational environment. A clear expectation of what is being assessed is a key to training students. Traditional assessments are provided in the curriculum; ie quizzes. The assessments found in this section are assessment rubrics for project-based learning. There are many other tools that a teacher may use, but this section provides some examples. Rubrics allow all stakeholders to see what is being measured.

Writing Criteria Rubric - Writing is a process and good writing requires several steps: brainstorming, outlining, prewriting, and editing. This is a simple rubric that check for those steps.

Engineering Journal Rubric - Explains to students what is expected in their engineering journals.

Presentation Rubric - Helps students determine what a good presentation should include.

Request for Proposal Rubric - Helps students to determine what is being evaluated in their RPF submission.

Work Habit Evaluation - This is a great tool for students to use to develop strong work habits.

Workplace Competencies Rubric - This rubric helps students to develop the skills that are valued by industry.

Internal Design Rubric - This evaluation tool helps students understand the expectations and preparation needed for an internal design review.

External Design Review - This evaluation tool helps students understand the expectations and preparation needed for an external design review.

Getting Started/Fundamentals/Introduction to Programming

Introduction to Programming

Before you begin to write code you need to understand how to talk to your robot, in other words to begin to think like a programmer. ROBOTC syntax has specific rules for you to follow. Below are links to resources that you will find helpful.

ROBOTC 2.0 Update

ROBOTC® Curriculum for TETRIX™ & LEGO® MINDSTORMS®

Introduction to Programming

Thinking About Programming Video Set - The "Programmer and Machine" and "Planning and Behaviors" videos explain to students the role of the programmer and the machine, and how the programmer must learn to think like a machine in order to program robots. The videos are designed to explain programming concepts to beginners.

Behaviors and Flowcharts & Pseudocode Helper Pages - These are reference PDFs that students can use as study guides. The helper pages are designed to be guides to the topics.

Behaviors

A behavior is a sequence of actions that a robot performs in response to a specific event. Behaviors are the building blocks of a program. They are used to control the robot's movement, sensing, and other actions.

Basic Behaviors

Behavior	Code Snippet
Move forward	<code>motor[1] = 100;</code>
Move backward	<code>motor[1] = -100;</code>
Turn left	<code>motor[1] = 100; motor[2] = -100;</code>
Turn right	<code>motor[1] = -100; motor[2] = 100;</code>
Stop	<code>motor[1] = 0; motor[2] = 0;</code>

Complex Behaviors

Behaviors can be combined to create more complex actions. For example, a robot could be programmed to move forward until it reaches a wall, then turn left and move forward again.

Pseudocode & Flow Charts

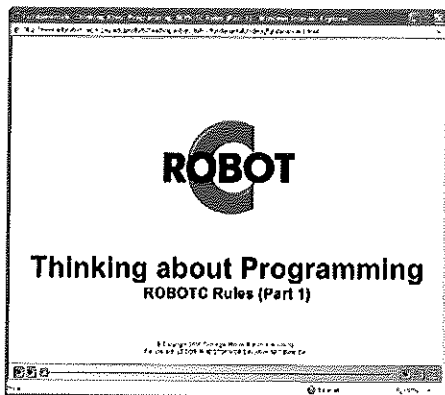

Pseudocode is a way of writing a program that is easy to understand. It is a series of instructions that describe what the robot should do. Flowcharts are a visual representation of a program. They use boxes and arrows to show the sequence of actions that the robot will perform.

Sample Flowchart

```

graph TD
    Start([Start]) --> MoveForward[Move forward]
    MoveForward --> IsWallDetected{Is Wall Detected?}
    IsWallDetected -- No --> MoveForward
    IsWallDetected -- Yes --> TurnLeft[Turn left]
    TurnLeft --> MoveForward
    MoveForward --> End([End])
  
```

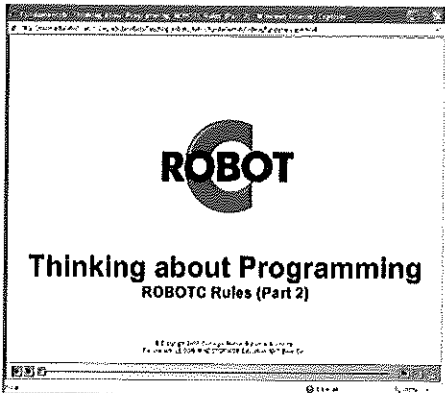

Getting Started/Fundamentals/Introduction to Programming

Thinking about Programming ROBOTC Rules Parts 1 & 2 - This video set builds the foundational knowledge that student must develop to begin to program using any syntax-based programming language. This video set introduces syntax concepts in a sequential and logical manner.

Whitespace, Comments, and Reserved Words Helper Pages - These are reference PDFs that students can use for reference or as study guides.

Thinking About Programming and ROBOTC Programming Quiz - One page quiz designed to check students understanding of introductory programming topics.

White Space

White space is the use of spaces, tabs, and blank lines in a program. Proper use of white space is a good habit to develop in the beginning of programming. It makes the code easier to read and understand. The ROBOTC compiler does not care about white space, but it is a good habit to develop.

Program White Space

```

// Example 1: Proper White Space
// Example 2: Improper White Space
// Example 3: Proper White Space
// Example 4: Improper White Space

```

Program White Space

```

// Example 5: Proper White Space
// Example 6: Improper White Space
// Example 7: Proper White Space
// Example 8: Improper White Space

```

Reserved Words

Reserved words are words that have a special meaning in the ROBOTC programming language. They are used to control the flow of the program and to perform other tasks. The ROBOTC compiler will not allow you to use these words as variables or other identifiers.

Reserved Words

```

// Example 1: Reserved Word
// Example 2: Reserved Word
// Example 3: Reserved Word
// Example 4: Reserved Word

```

Comments

Comments are used to explain the code in a program. They are ignored by the compiler and are only for the programmer's use. Comments can be used to describe the purpose of the code, to explain complex logic, or to provide a history of changes to the code.

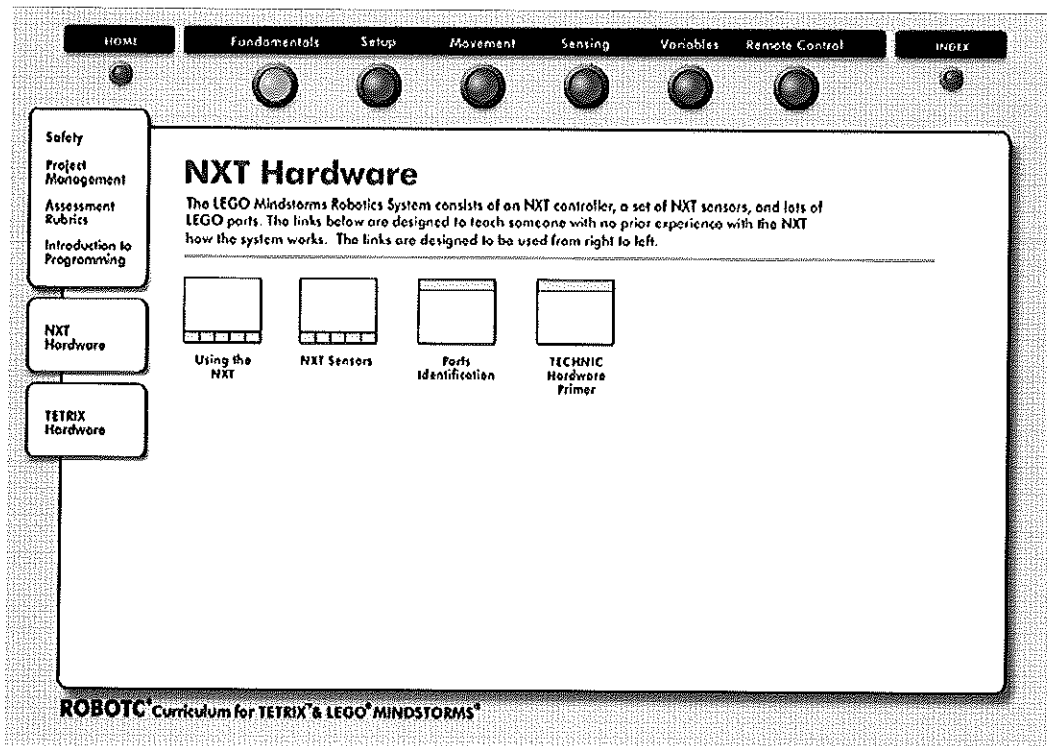

Comments

```

// Example 1: Comment
// Example 2: Comment
// Example 3: Comment
// Example 4: Comment

```

Getting Started/Fundamentals/NXT Hardware

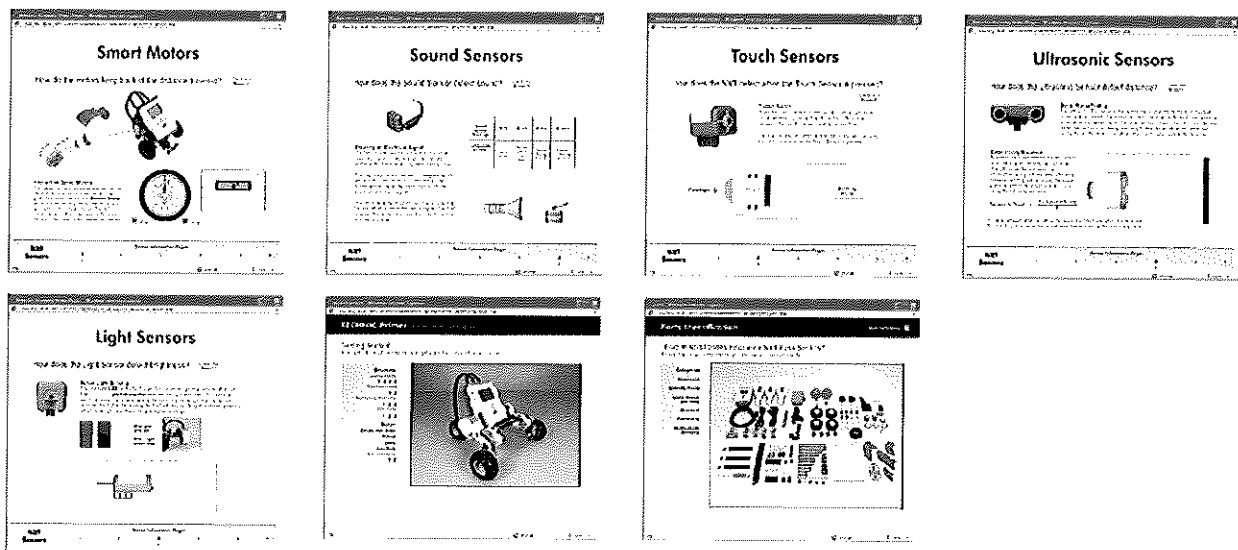

NXT Hardware

NXT Sensors Slide Show - The Sensors Slide Shows introduce new learners to the MINDSTORM sensors that are part of the base set: the smart motors, touch, light, ultrasonic and sound sensors. Students will learn how they work and what type of feedback they record.

NXT Parts Identification - Graphically introduces students to the parts and how they work.

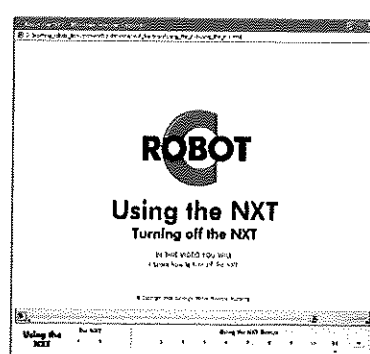

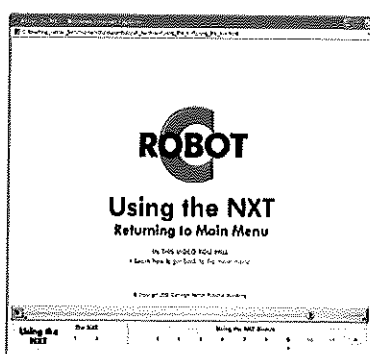

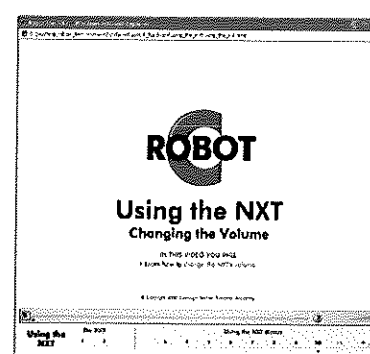

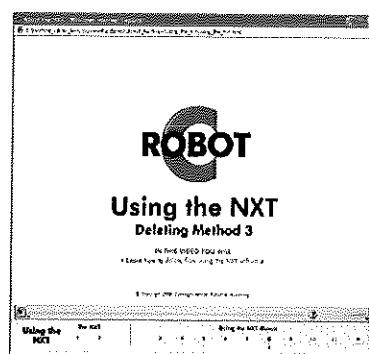

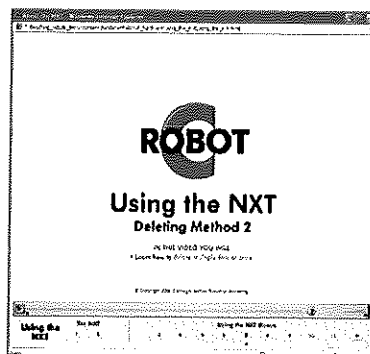

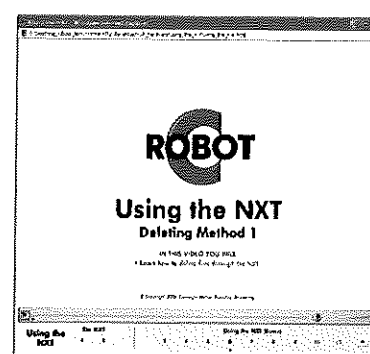

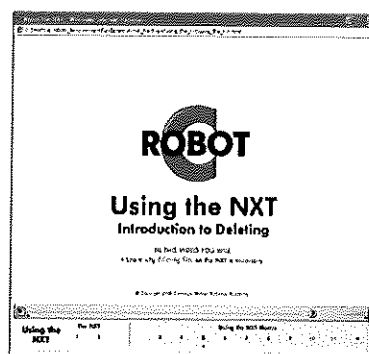

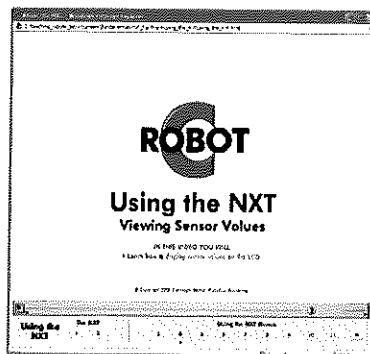

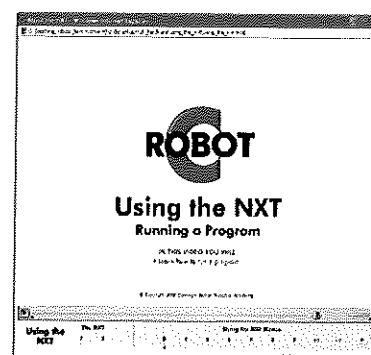

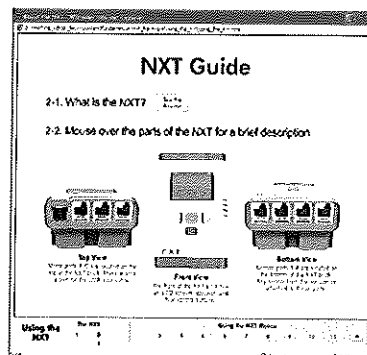

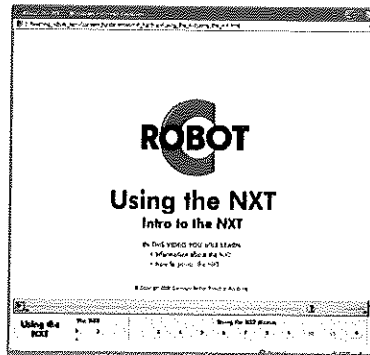

TECHNIC Hardware Primer - The TECHNIC hardware primer is designed to show students how LEGO TECHNIC parts can be used to build subassemblies that they can use in their robot designs.

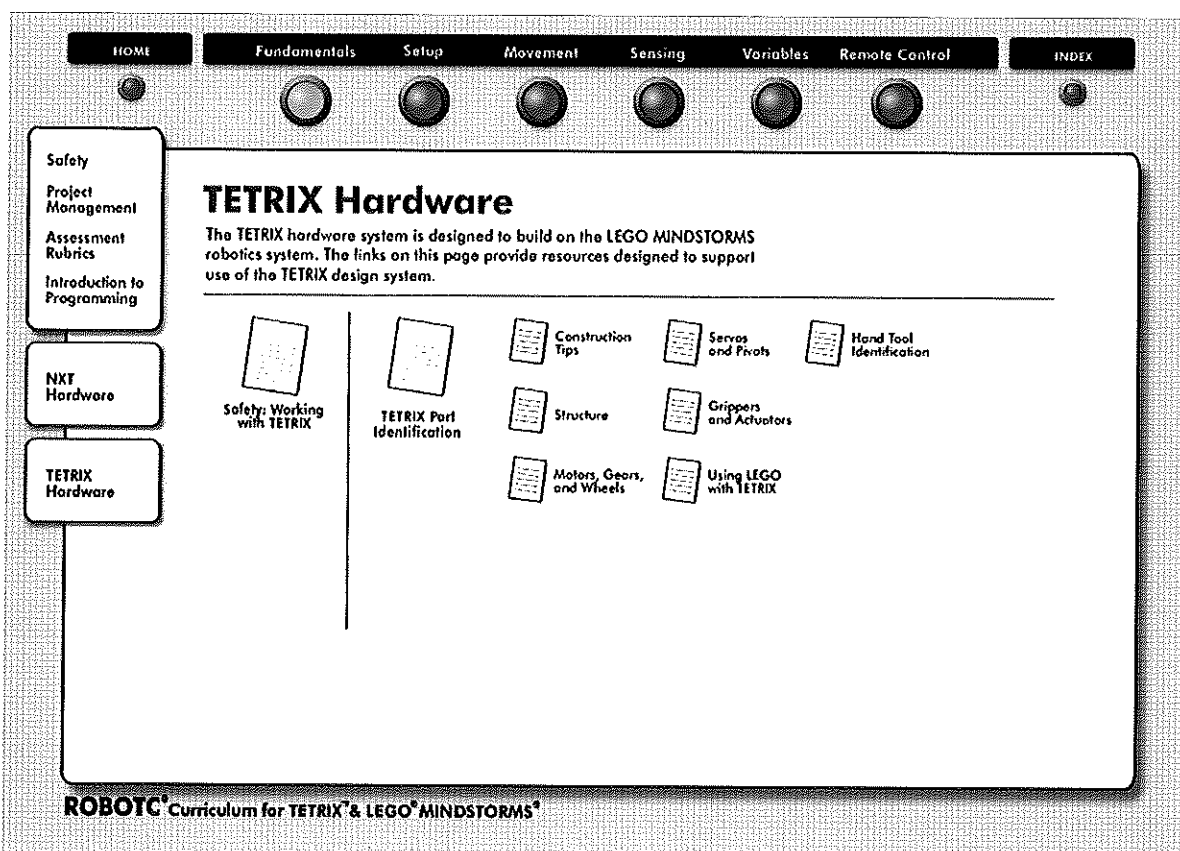

Getting Started/Fundamentals/NXT Hardware

NXT Hardware

Using the NXT Slide Show - Assumes that the user has never used an NXT. There are 11 sections of the slide show that include: Introduction to the NXT, NXT Guide, Running a Program, Viewing Sensor Values, Introduction to Deleting, Deleting Programs 1, 2 & 3, Returning to the Main Menu, Changing the Volume, and Turning Off the NXT. This resource is a very valuable teaching tool for students just beginning to use the NXT.

Getting Started/Fundamentals/TETRIX Hardware

TETRIX Hardware PDFs

Safety Working with TETRIX - This three page PDF pictorially shows PITSCO-recommended safe methods of working with TETRIX hardware. This PDF will serve as a great review of safety when beginning to work with the TETRIX system.

TETRIX Part Identification - This five page PDF depicts all of the TETRIX parts along with their names. If students are having trouble identifying part names, this is the place to look.

TETRIX Construction Tips - This six page PDF contains a compilation of best practices for assembly of the TETRIX parts. The high resolution pictures with descriptions are designed to show best practices in TETRIX construction and also to stimulate student creativity.

Building Structures with TETRIX - This six page PDF shows how subassemblies can be made to create larger structures using the TETRIX building systems.

Motors, Gears, and Wheels - This six page PDF covers how to properly mount motors, motor safety, motor direct drive solutions, motor indirect drive solutions, how to assemble driven wheel systems, and the Omni Directional Wheel.

Servos and Pivots - This eight page PDF covers the servo's range of motion, and shows examples of a single servo mount, a single servo mount with a pivot, a double servo mount, a double servo mount with a pivot, as well as examples of pivot structural elements.

Grippers and Actuators - This seven page PDF illustrates multiple grippers that can be made using the TETRIX system.

Merging TECHNIC and TETRIX - This four page PDF shows how to use the Hard Point connectors, and how to attach Hard Point Connectors, the NXT, HiTechnic Controllers, and NXT Sensors.

Hand Tool Identification Page - A one page handout that shows pictures of common tools with their names.

TEBEX™ Hardware

Safety

- 1 Personal Safety
- 2 Technical Safety
- 3 Personal Safety

1. Personal Safety

The TEBEX is not intended for use by persons younger than 18 years old. Please always follow the instructions in this manual and the safety instructions. The total allowed weight for personnel must never be exceeded when working with any vertical axis.

Keep the clothing and all parts of your body away from the moving components of the device and do not touch the parts that could result in any personal injuries and prevent the electrical wiring.

Only use a crane authorized to lift at least 2000 kg and 6 m height.

4. Preparing Wall Joists & Top Plates
5. Laying Out 2x6 Studs & Sillings
6. Erecting walls
7. Roofing
8. Final Inspection

Truss Alignment

The base portion must be at an exact 90 degree incline distribution using both a level and square

The most thought toward any job the Carpenter is construction of the frame which serves as the skeleton. Always show square trusses and be aware of their center. Or, in other words, the shorter pieces have to be cut and put back together into a trussing.

The base portion must be at a 90 degree incline to be constructed at 90 degree angles from the truss and usually at 90 degree.

TETRO™ Hardware Primer

Structures

WALL

- Embedding a Drain
- Drain Holes
- 2" x 6's

• Embedding a Drainage

Set the 20" x 20" drain in place and pick the type with the most holes for a given hole size. The drain is placed into the concrete before pouring the final wall and with the spirit level to set it to being \pm

along the bottom of the big channels to the bottom of the smaller channels which you find most to be used. It can also come down that the drain can come through the hole and the holes are not at the end of the pipe hole.

You can use the holes instead of the hole and the corner of the pipe to a right and left drain hole.

Extend the long side of the wall and of the system along the TETRO™ two parallel sides of the bottom.

Repeat these steps for the other three corners.

Getting Started/Setup/NXT Setup

NXT Setup

To begin programming your NXT using the ROBOTC 2.0 software requires a three step process: Step one, build your robot; Step two, download the firmware; and Step three, download a sample program.

1	2	3
<p>Build REM (Recommended)</p> <p>Printable REM Building Instructions</p> <p>Touch+Light Attachment</p> <p>Side Button Attachment</p>	<p>Download Firmware</p> <p>Firmware Quiz</p>	<p>Download Sample Program</p> <p>Running a Program</p> <p>Downloading Quiz</p>

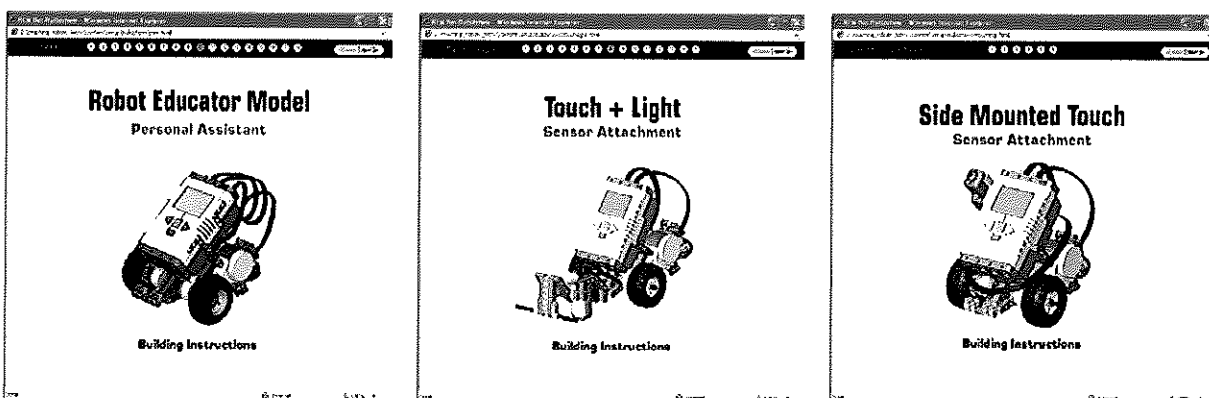

ROBOTC® Curriculum for TETRIX® & LEGO® MINDSTORMS®

NXT Setup Page

Build the REM Robot - All of the ROBOTC for MINDSTORMS lessons use the "Robot Educator Model" plus attachments. This page provides building instructions in both a printable and digital format.

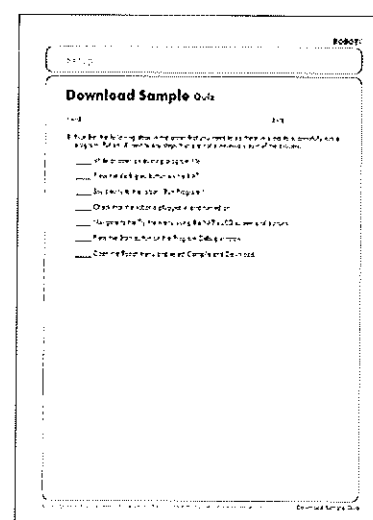

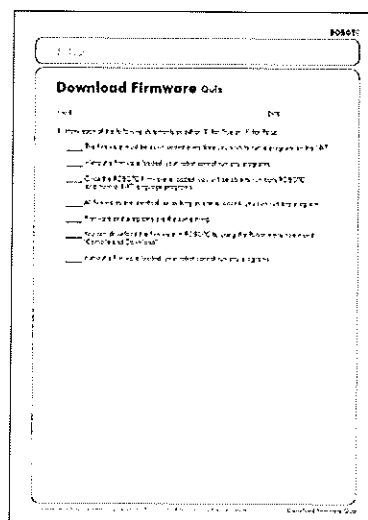

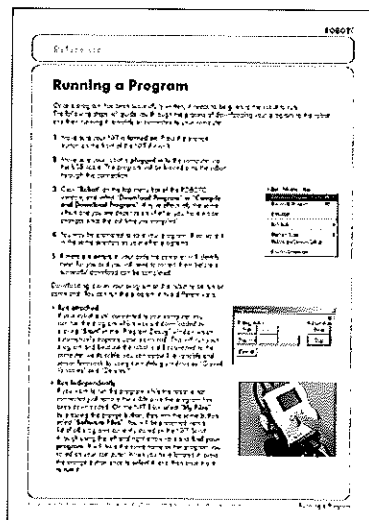

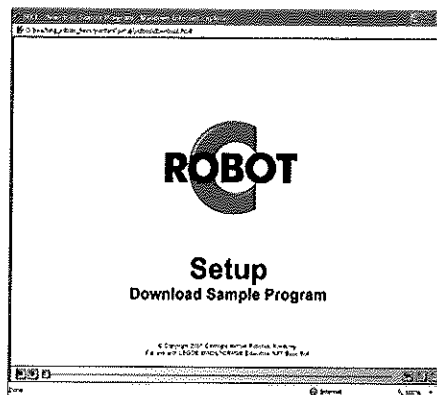

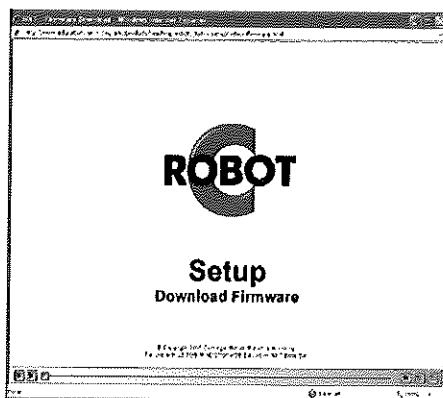

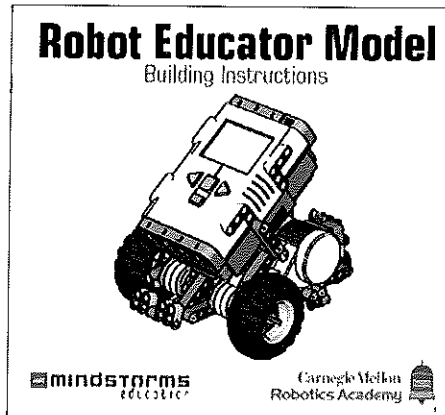

Download Firmware Video and Quiz - Students will learn what firmware is and how to download it to their robots. There is also a quiz designed to check student understanding.

Download Sample Program and Quiz - Students will learn to download their first ROBOTC program and test it on their NXT. The lesson also includes a PDF helper page as well as a quiz designed to check student understanding.

Getting Started/Setup/NXT Setup continued

NXT Setup Page Resources Continued

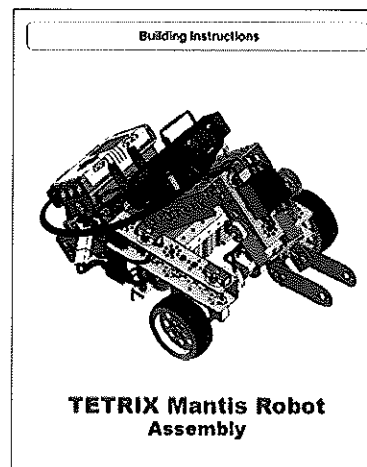

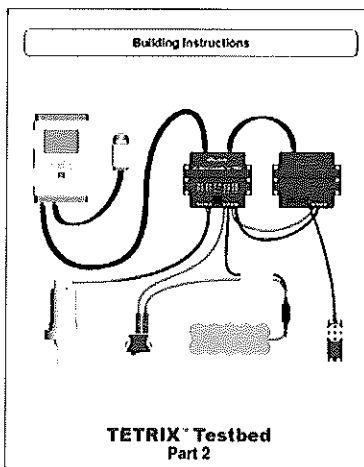

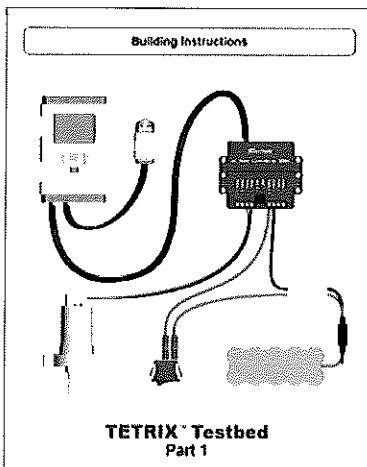

Getting Started/Setup/TETRIX Setup

The screenshot shows a web interface for the ROBOTC Curriculum for TETRIX & LEGO MINDSTORMS. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. On the left is a sidebar with buttons for NXT Setup and TETRIX Setup. The main content area is titled "TETRIX Setup" and contains a paragraph: "The links below provide a quick step-by-step guide to test the integration of the NXT controller, the TETRIX motor controller, and TETRIX servo controller. Begin by building the testbed and downloading sample programs, and then build the TETRIX 'Mantis' robot." Below this text are two numbered links: 1. TETRIX Testbed (with sub-links for Testbed Instructions (Part 1) and Testbed Instructions (Part 2)) and 2. Mantis Building Instructions. At the bottom of the page is the text "ROBOTC® Curriculum for TETRIX™ & LEGO® MINDSTORMS®".

TETRIX Setup Page

TETRIX Testbed Video Instructions - Students are led step-by-step as they build their first working TETRIX system. We recommend that students build and test their TETRIX testbed *before* they connect the system to their robot. It will make electronic troubleshooting much easier. The lesson is designed as a two part lesson: first, connect the motor controller and test that system; second, connect the servo controller and test the combined system. The lesson is available as a printable PDF or as a video slide show with voice over and animations.

TETRIX Mantis Robot Building Instructions - The Mantis building instructions allow students to build their first TETRIX robot from a set of plans.

Introduction to Programming...

Introduction to Engineering

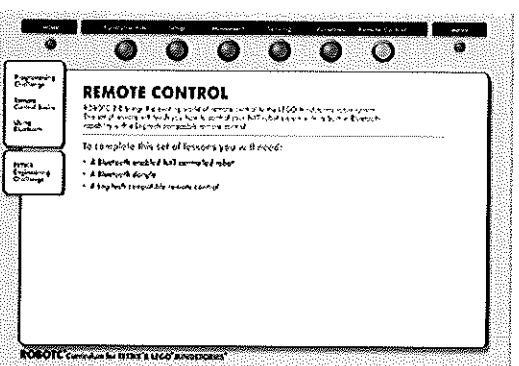

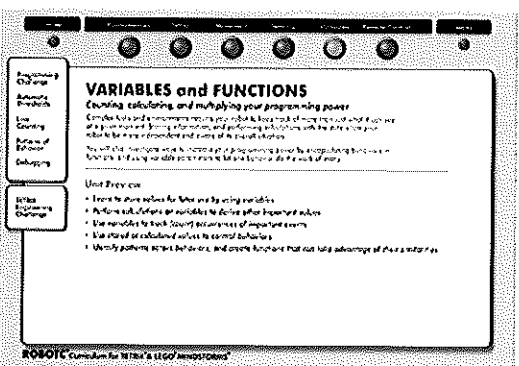

Note: The curriculum is designed so that students complete the NXT lessons before they complete the TETRIX lessons.

The Introduction to Programming Curriculum is divided into four instructional units: Movement, Sensing, Variables and Functions, and Remote Control. Each unit contains a number of Lesson Sets designed to teach a particular concept. Each unit is organized around a "Unit Programming Challenge". The solution for the Unit Programming Challenge is taught as students move through the individual Lesson Sets.

The student will find other exercises designed to reinforce their programming skills or designed to give them a deeper understanding of the NXT or TETRIX hardware. At the end of the Variables Unit there is a TETRIX Engineering Challenge called the TETRIX Robot Mining Challenge. This challenge can be solved using either the TETRIX or the NXT hardware. This challenge is designed to be solved by an engineering team and will require several weeks for students to adequately solve.

Introduction to Programming/Movement/Programming Challenge

MOVEMENT

Make your way through the Labyrinth...

Your first project-based challenge will be a maze called "The Labyrinth". Successful completion of this challenge will require a thorough understanding of the movement behaviors and commands available in ROBOTC.

Beware! Not all versions of the Labyrinth are the same. Your board, your robot, and your program may all differ from the one shown in the video... now is your time to shine as a problem-solver and programmer!

Unit Preview

- Examine and modify sample code to make the robot go forward
- Experiment with motor power levels to discover other movement patterns, like turning and reversing
- Enable closed-loop control to improve straightness and consistency

ROBOTC® Curriculum for TETRIX® & LEGO® MINDSTORMS®

The Movement Unit

The Movement Unit is taught using three Lesson Sets and a programming challenge. The Lesson Sets begin using sample code that is already included in ROBOTC. The first Lesson Set, Moving Forward, teaches students in a very lockstep manner what each line of code does while introducing them to moving motors for specific amounts of time. The second Lesson Set, Speed and Direction, explains motor power levels and how to reverse polarity. The second Lesson Set includes several "engineering labs" that the students will complete. The engineering labs place students in the role of engineer where they run their robots, measure results, iteratively test the results to determine reliability, and then extrapolate from their data set to predict new robot behaviors. The third Lesson Set, Improved Movement, begins to teach very important lessons about PID control, motor synchronization, and setting motor targets.

The Movement Unit also includes several programming challenges where students are challenged to solve simple movement programming challenges.

It will be important to remind students that although the initial work may seem easy, that the skills that they learn in the movement unit are foundational pieces that they must understand before they move to the sensing unit.

Introduction to Programming/Movement/Programming Challenge

The screenshot shows the ROBOTC Curriculum website. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar with a list of topics: Programming Challenge, Moving Forward, Speed & Direction, Improved Movement, and TETRIX Movement. The main content area is titled "Programming Challenge" with the subtitle "Can you handle the Labyrinth...?". It features a large image of a tablet displaying a labyrinth puzzle. Below the image are icons for "Labyrinth Challenge" and "Solution Video". At the bottom of the page, it says "ROBOTC® Curriculum for TETRIX™ & LEGO® MINDSTORMS®".

Labyrinth Programming Challenge

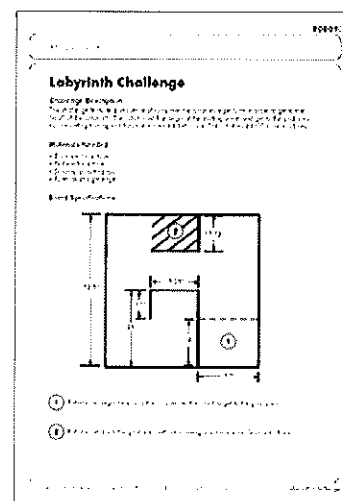

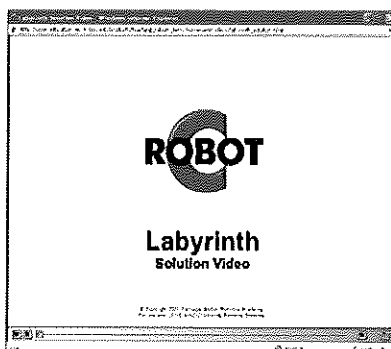

Each Programming Unit (Movement, Sensing, Variables and Remote Control) contains a programming challenge that is designed to place the learning into an interesting context. In the "Movement" Lesson Set the programming challenge is the "Labyrinth Challenge".

In this challenge, students will learn:

- Behavior based programming logic
- How to program their robots to accurately move forward, backward and turn
- The syntax rules related to programming using ROBOTC

Labyrinth Challenge Teacher Resources

Each programming challenge comes with a PDF that explains the rules to the challenge as well as a video solution. These Labyrinth challenge resources are pictured on the left.

Introduction to Programming/Movement/Moving Forward

The screenshot shows the ROBOTC Curriculum website interface. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar with a list of topics: Programming Challenge, Moving Forward, Speed & Direction, Improved Movement, and TETRIX Movement. The main content area is titled 'Moving Forward' with the subtitle 'Moving forward using motor commands and timing'. It features two numbered sections: 1. Program Dissection and 2. Timing. To the right of these sections are icons for 'Sumo-Bot Challenge' and 'Moving Forward Quiz'. A 'Printable Version' button is located in the top right corner of the main content area. At the bottom of the page, it says 'ROBOTC® Curriculum for TETRIX® & LEGO® MINDSTORMS®'.

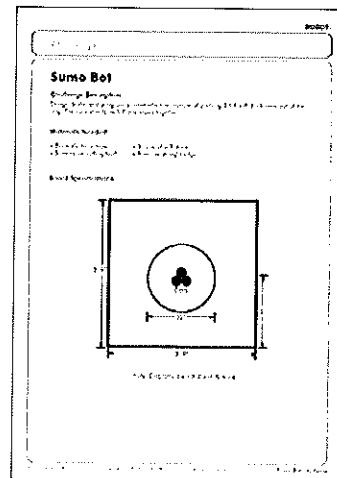

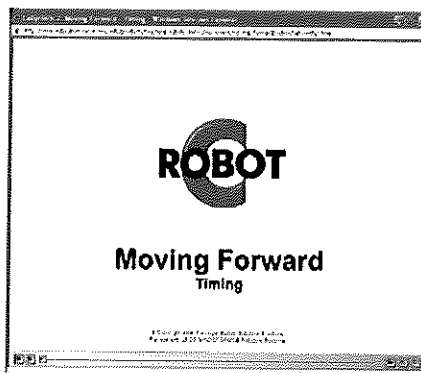

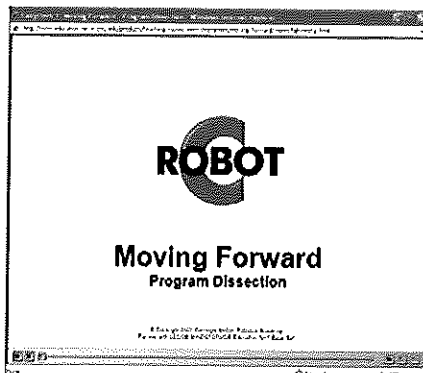

The Moving Forward Lesson Set

Each Lesson Set is designed to teach a related set of programming concepts, and is designed to give students confidence opening a program and understanding what the individual lines of code mean. Every set is supported with the following video and print resources:

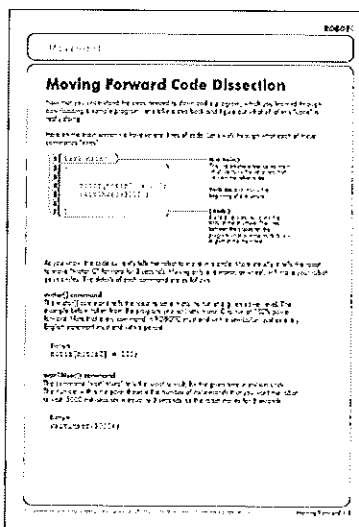

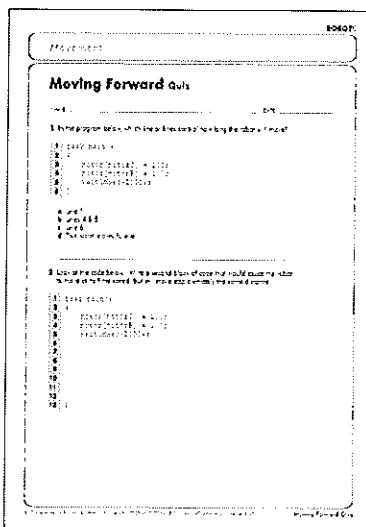

Program Dissection Video - Students are given a line by line description of the code used in the first sample program.

Timing Video - Timing offers the least accurate way of programming a robot to move from point to point. It is also the simplest method of programming. Students are introduced to wait-states.

Sumo-Bot Challenge - This fun challenge involves developing a programming/mechanical solution to push as many cans as possible out of a ring.

Introduction to Programming/Movement/Moving Forward continued

Additional Moving Forward Lesson Set Resources

Pictured at the left are two additional resources that accompany the Moving Forward Lesson Set.

The Moving Forward Quiz

The Moving Forward PDF - Each set of videos is accompanied by a PDF version of the script. The PDF version includes lots of pictures and text to describe everything that is shown in the videos. The PDF can be used either to accompany the video instruction or as a study guide.

Introduction to Programming/Movement/Speed and Direction

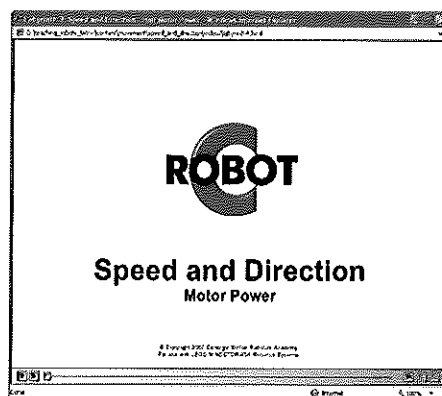

The Speed and Direction Lesson Set

The Speed and Direction Lesson Set consists of two video lessons, two engineering challenges, three open-ended programming challenges, and a quiz. The resources are shown and explained in on the next page.

Introduction to Programming/Movement/Speed and Direction cont.

Motor Power Lesson

The first video lesson, Motor Power, teaches students how to change the power level on the robot. Students learn that as they change the power level, they are in effect changing the robot's speed. They will also complete an Engineering Lab named "NXT Wait States/Power Level Investigation". In this investigation, students program their robots at a variety of power levels and keep the amount of time the robot runs constant. In the investigation students identify if there is a proportional relationship between power levels and speed.

Engineering Lab

NXT Wait States/Powerlevel Investigation

Investigation Summary

Goal: Investigate the relationship between power level and speed. Program the robot to run at different power levels for a fixed amount of time (10 seconds) and measure the distance traveled. Record the data in the table below.

Simple Code:

```

1. Motor[1] = 100;
2. Wait[1] = 10;
3. Motor[1] = 0;

```

Procedure: 1. Set the motor power to 100. 2. Wait for 10 seconds. 3. Stop the motor. 4. Measure the distance traveled. 5. Repeat steps 1-4 for power levels 75, 50, 25, and 10.

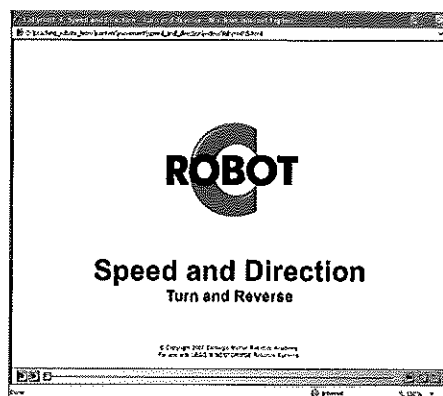

Table:

Power Level	Time (s)	Distance (cm)
100	10	
75	10	
50	10	
25	10	
10	10	

Analysis: Is there a proportional relationship between power level and speed? Explain your answer.

Turn and Reverse Lesson

In the "Turn and Reverse" lesson, students learn about polarity. The Lesson Set includes a 10 page PDF, shown at the right, designed to complement the videos. It also includes 3 open ended programming challenges. Two of the programming challenges are shown below: Robo-Slalom and Line Painter Bot. Students complete the lesson with an Engineering Challenge, where they are asked to iteratively test robot turns given a specific power level and a target angle and then use that data to predict what the "wait state" will be to complete other turns.

Engineering Lab

Speed and Direction Turn and Reverse

Goal: Investigate the relationship between power level and turn angle. Program the robot to turn at different power levels for a fixed amount of time (10 seconds) and measure the turn angle. Record the data in the table below.

Simple Code:

```

1. Motor[1] = 100;
2. Wait[1] = 10;
3. Motor[1] = 0;

```

Procedure: 1. Set the motor power to 100. 2. Wait for 10 seconds. 3. Stop the motor. 4. Measure the turn angle. 5. Repeat steps 1-4 for power levels 75, 50, 25, and 10.

Table:

Power Level	Time (s)	Turn Angle (deg)
100	10	
75	10	
50	10	
25	10	
10	10	

Analysis: Is there a proportional relationship between power level and turn angle? Explain your answer.

Engineering Lab

Robo-Slalom

Challenge Description: Program the robot to slalom through a series of obstacles. The robot must turn left and right to pass through the obstacles without touching them.

Table:

Power Level	Time (s)	Turn Angle (deg)
100	10	
75	10	
50	10	
25	10	
10	10	

Engineering Lab

Line Painter Bot

Challenge Description: Program the robot to paint a line on a surface. The robot must turn left and right to follow the line.

Table:

Power Level	Time (s)	Turn Angle (deg)
100	10	
75	10	
50	10	
25	10	
10	10	

Engineering Lab

NXT Turning Investigation

Goal: Investigate the relationship between power level and turn angle. Program the robot to turn at different power levels for a fixed amount of time (10 seconds) and measure the turn angle. Record the data in the table below.

Table:

Power Level	Time (s)	Turn Angle (deg)
100	10	
75	10	
50	10	
25	10	
10	10	

Introduction to Programming/Movement/Improved Movement

The screenshot shows a web interface for the ROBOTC Curriculum. At the top is a navigation bar with buttons: HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a main content area titled "Improved Movement" with the subtitle "Using closed-loop control to improve consistency of movement". The content is organized into four numbered columns:

- Column 1:** "Principles of PID" with a sub-link "PID Speed Control".
- Column 2:** "PID Control".
- Column 3:** "Synchronized Motors" with sub-links "Motor Synchronization" and "Synching Motors Engineering Lab".
- Column 4:** "Target Distances" with a sub-link "Improved Movement Quiz".

On the left side, there is a sidebar with links: "Programming Challenge", "Moving Forward", "Speed & Direction", "Improved Movement", and "TETRIX Movement". On the right side, there is a "Printable Version" link. At the bottom of the page, it says "ROBOTC Curriculum for TETRIX & LEGO MINDSTORMS".

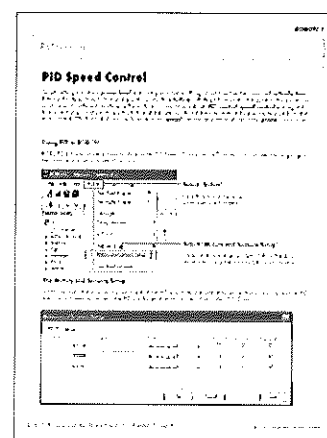

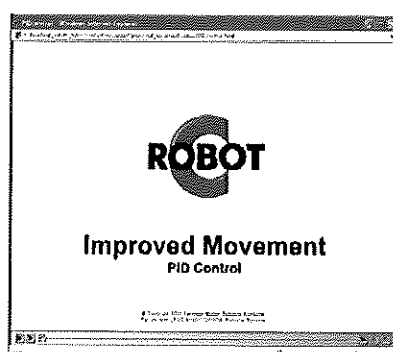

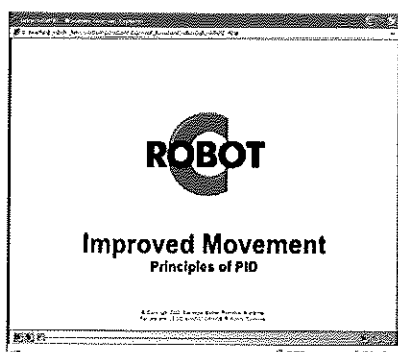

Improved Movement Lesson Set

The first half of the Improved Movement Lesson Set teaches students about PID speed control as well as how to use the Motor and Sensor Setup Window, the Debug Windows, and the NXT Devices window. The following resources are available to teach PID control:

The Principles of PID Video - This video teaches students what PID (Proportional Integral Derivatives) is and how it uses a closed loop control system to regulate speed control.

The PID Control Video - This video teaches students how to use ROBOTC's debugger to see the NXT's speed regulation. Students will use the debugger windows to watch the internal feedback mechanisms built into the system.

PID Speed Control Reference Page - This two page handout explains PID, and shows how to monitor PID using ROBOTC's debugging window.

Introduction to Programming/Movement/Improved Movement cont.

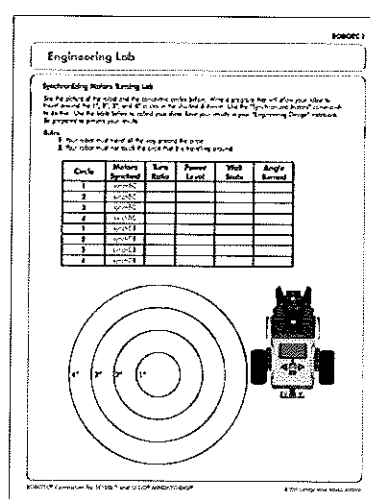

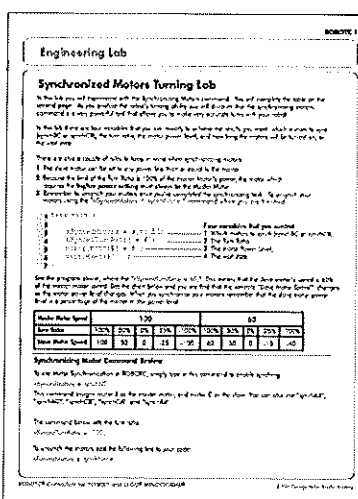

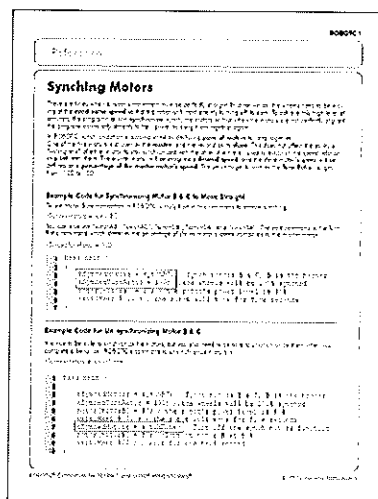

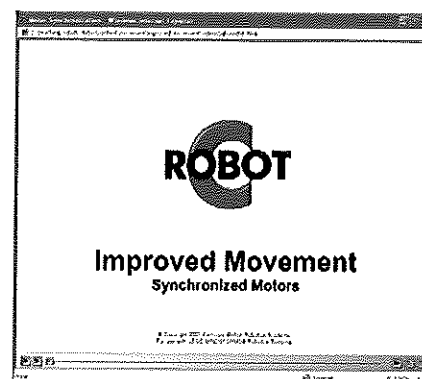

Synchronized Motors Lesson Set

ROBOTC enables the programmer to synchronize the robot's wheel movements. The Lesson Set contains the following resources:

Synchronized Motors Video - Teaches students how to use ROBOTC reserved words to control their robots.

Synchronized Motor Reference Page - Can be used as a handout for a study guide or as a reference page.

Synchronized Motors Engineering Lab - Students perform a set of iterative experiments where they test robot performance and collect data designed to promote understanding of robot synchronization.

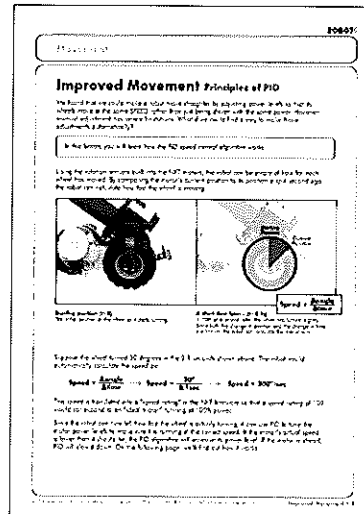

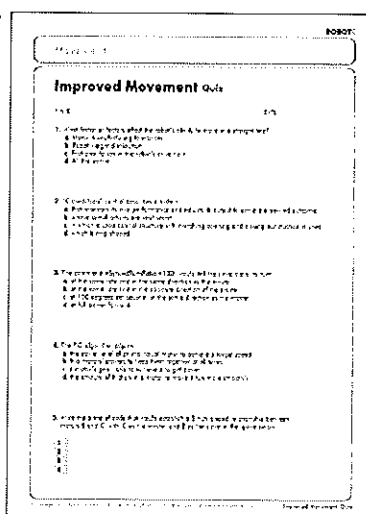

nMotorEncoder Command and Target Distances Lesson Set

Encoders are used by the robot to count how many times a wheel on the robot turns. Students are introduced to encoders in this lesson allowing them to achieve better control of their robot.

The Target Distance Video - Teaches students how encoders work and gives them a naive understanding of the nMotorEncoderTarget function.

Improved Movement Lesson Set PDF - This PDF complements the videos used to teach the Improved Movement Lesson Set.

Introduction to Programming/Sensing

SENSING

Open your robot's eyes...

Robots separate themselves from simpler machines through their ability to detect and respond to their surroundings. The "Obstacle Course" challenge will put both your robot and your programming skills to the test.

Beware! By nature, the Obstacle Course changes from run to run. Your robot needs to be able to account for these differences using sensors and a well-constructed program!

Unit Preview

- Learn how to use sensor feedback to control when behaviors run
- Work with different sensors under similar conditions
- Learn how (and why) to calculate and use threshold values
- Iteratively improve your program's implementation of a line tracking behavior
- Distinguish between loops and conditional statements, and use each at the appropriate times
- Investigate the use of direct sensor values in behaviors

ROBOTC® Curriculum for TETRIX™ & LEGO® MINDSTORMS®

Sensing

The Sensing Unit consists of six Lesson Sets for the NXT and one Lesson Set for TETRIX. Everything that a student learns about programming sensors for the NXT systems can be applied to the TETRIX system.

The lessons are designed to be taught in a sequential order from top to bottom. The lessons start with the touch sensor because of its simplicity, then move to the ultrasonic and sound sensors. If students skip one of the Lesson Sets, then they run the risk of missing a programming concept that was taught in a prior lesson. Do the lessons in sequence.

Programming Challenge

A series of challenges that can only be negotiated with full sensing capabilities

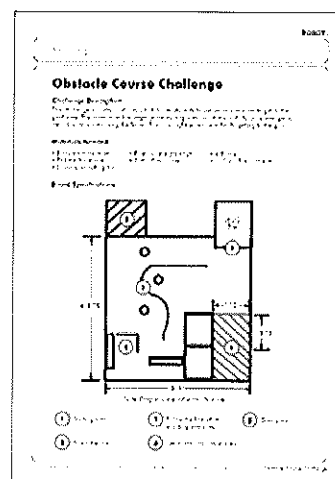

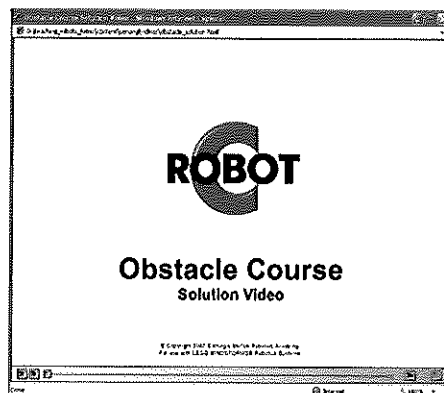

ROBOTC Curriculum for TETRIX® & LEGO® MINDSTORMS®

The Obstacle Course Programming Challenge

Students are required to use feedback from all sensors to complete the obstacle course. There is more than one way to solve this programming challenge, and individual students will develop their own programming style. For beginners, it will be important for the teacher to reinforce breaking robot behaviors down into their simplest parts.

The Obstacle Course Video - Shows a video solution to the programming challenge.

The Obstacle Course Handout - PDF that describes the challenge in terms of robot behaviors.

Introduction to Programming/Sensing/Touch Sensor

The screenshot shows a web interface for the ROBOTC Curriculum for TETRIX & LEGO MINDSTORMS. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar menu with links to Programming Challenge, Wall Detection (Touch), Wall Detection (Ultrasonic), Forward for Distance, Forward Until Dark, Line Tracking, and Volume & Speed. The main content area is titled 'Wall Detection (Touch)' and includes the subtitle 'Using the Touch Sensor and the while loop to respond to physical contact'. It features four numbered steps: 1. Touch vs. Timing, 2. Configuring Sensors, 3. The While Loop, and 4. Putting It Together. Each step has a corresponding icon and a list of resources. A 'Printable Version' link is located in the top right corner. At the bottom of the page, it says 'ROBOTC Curriculum for TETRIX & LEGO MINDSTORMS'.

Sensing - Touch Sensor

The Wall Detection Lesson Set provides a comprehensive set of materials designed to introduce students to sensors. Students begin to solve the obstacle course by learning how a touch sensor works, how to configure the touch sensor using the motors and sensors setup windows, how to name sensors, and how to build a new program from scratch. As they learn about touch sensors, they will also learn about while loops, structures, boolean logic, conditional statements, ROBOTC reserved words, and how to use ROBOTC's built-in debugger windows to see sensor feedback values. Students will have access to the following video and print resources:

The Touch Versus Timing Video - This video introduces the touch sensor and explains how it will be used to help solve the obstacle course challenge.

The Configuring Sensors Video - This video shows students how to configure sensors using ROBOTC's Motors and Sensors Configuration Menu. It also shows students how to use the debugger screens to see sensor feedback.

The While Loop Video - Teaches students about conditional statements and how they control the while loop structure.

The Putting It All Together Video - This video is a step-by-step tutorial that begins with a blank program, then builds a program starting with configuring the sensors through setting up conditional statements and controlling motors.

Touch and Light Sensor Attachment - Instructional slide show that shows how to connect the sensor to the robot.

Sense Plan Act Reference Page - One page handout that describes the Sense-Plan-Act algorithm.

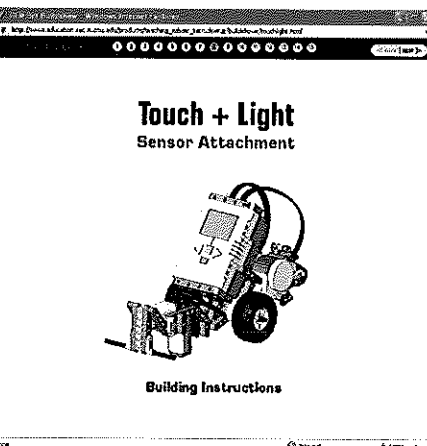

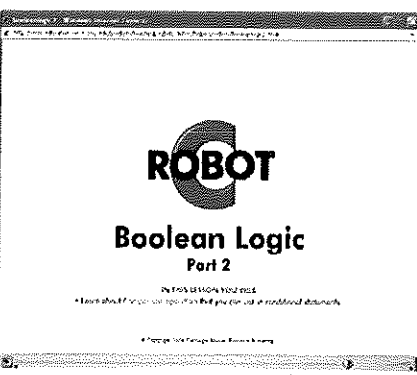

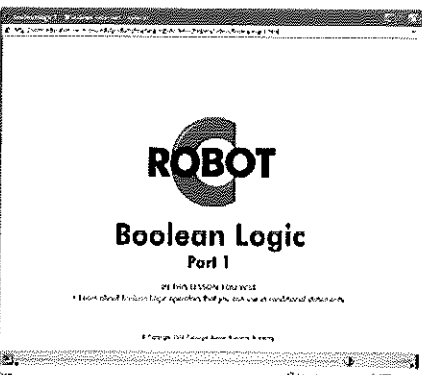

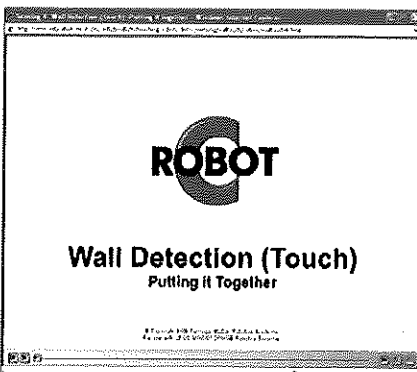

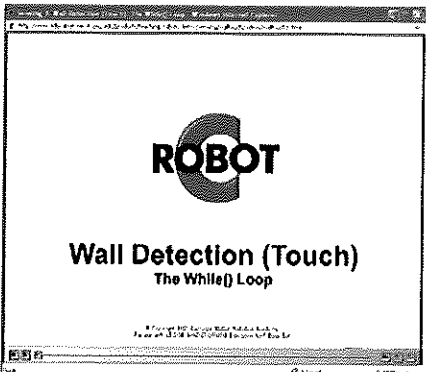

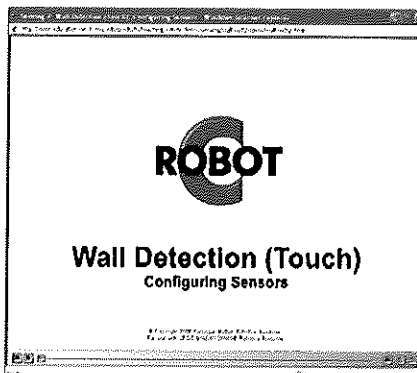

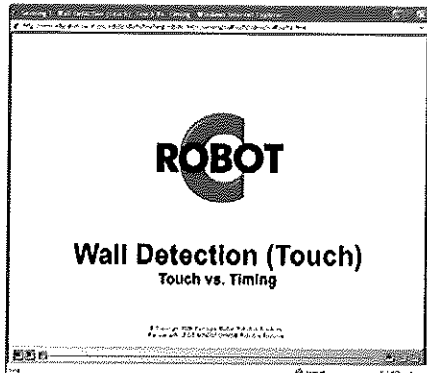

While Loop Reference Page - One page handout that describes the "while loop" structure.

Boolean Logic Videos 1 & 2 - The first video teaches students how conditional statements work. The second teaches them about logical operators. There is also a Boolean Logic 3 page PDF that complements the videos.

Robot Programming Challenges - This Lesson Set includes three open-ended programming challenges that can be solved by students: the Can Bot Challenge, Robo500 Challenge (Level 1) and the RoboMower Challenge (Level 1).

Introduction to Programming/Sensing/Touch Sensor

Sensing - Touch Sensor - Video Resources

Introduction to Programming/Sensing/Touch Sensor

Sensing - Touch Sensor - Print Resources

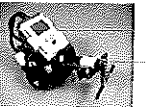

Challenge

Wall Detection (Touch vs. Timing) Level 1

Challenge Description
Write a program that drives a robot from a Touch Sensor to the other end of a table and back. A robot is provided.

Materials Needed
1. Robot
2. Touch Sensor

Robot Specifications
1. The robot must be able to move in a straight line for at least 10 cm.
2. The robot must be able to turn 90 degrees.

1. Place the robot on the table so that the touch sensor is at the 10 cm mark. The robot must be able to move in a straight line for at least 10 cm.

2. Write the program that drives the robot to the other end of the table and back. The robot must be able to move in a straight line for at least 10 cm.

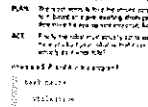

Challenge

Sense Plan Act (SPA)

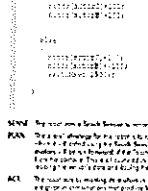

Challenge Description
Write a program that drives a robot from a Touch Sensor to the other end of a table and back. A robot is provided.

Materials Needed
1. Robot
2. Touch Sensor

Robot Specifications
1. The robot must be able to move in a straight line for at least 10 cm.
2. The robot must be able to turn 90 degrees.

1. Place the robot on the table so that the touch sensor is at the 10 cm mark. The robot must be able to move in a straight line for at least 10 cm.

2. Write the program that drives the robot to the other end of the table and back. The robot must be able to move in a straight line for at least 10 cm.

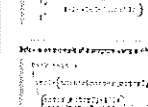

Challenge

While Loop

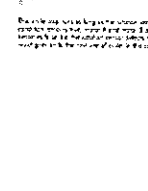

Challenge Description
Write a program that drives a robot from a Touch Sensor to the other end of a table and back. A robot is provided.

Materials Needed
1. Robot
2. Touch Sensor

Robot Specifications
1. The robot must be able to move in a straight line for at least 10 cm.
2. The robot must be able to turn 90 degrees.

1. Place the robot on the table so that the touch sensor is at the 10 cm mark. The robot must be able to move in a straight line for at least 10 cm.

2. Write the program that drives the robot to the other end of the table and back. The robot must be able to move in a straight line for at least 10 cm.

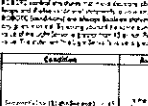

Challenge

Boolean Logic

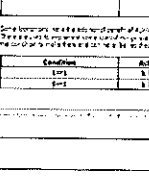

Challenge Description
Write a program that drives a robot from a Touch Sensor to the other end of a table and back. A robot is provided.

Materials Needed
1. Robot
2. Touch Sensor

Robot Specifications
1. The robot must be able to move in a straight line for at least 10 cm.
2. The robot must be able to turn 90 degrees.

1. Place the robot on the table so that the touch sensor is at the 10 cm mark. The robot must be able to move in a straight line for at least 10 cm.

2. Write the program that drives the robot to the other end of the table and back. The robot must be able to move in a straight line for at least 10 cm.

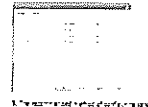

Challenge

Wall Detection (Touch) only

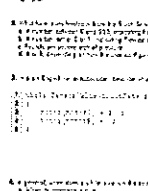

Challenge Description
Write a program that drives a robot from a Touch Sensor to the other end of a table and back. A robot is provided.

Materials Needed
1. Robot
2. Touch Sensor

Robot Specifications
1. The robot must be able to move in a straight line for at least 10 cm.
2. The robot must be able to turn 90 degrees.

1. Place the robot on the table so that the touch sensor is at the 10 cm mark. The robot must be able to move in a straight line for at least 10 cm.

2. Write the program that drives the robot to the other end of the table and back. The robot must be able to move in a straight line for at least 10 cm.

Challenge

Robo Mower Level 1

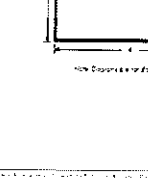

Challenge Description
Write a program that drives a robot from a Touch Sensor to the other end of a table and back. A robot is provided.

Materials Needed
1. Robot
2. Touch Sensor

Robot Specifications
1. The robot must be able to move in a straight line for at least 10 cm.
2. The robot must be able to turn 90 degrees.

1. Place the robot on the table so that the touch sensor is at the 10 cm mark. The robot must be able to move in a straight line for at least 10 cm.

2. Write the program that drives the robot to the other end of the table and back. The robot must be able to move in a straight line for at least 10 cm.

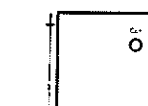

Challenge

Can Bot

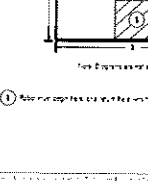

Challenge Description
Write a program that drives a robot from a Touch Sensor to the other end of a table and back. A robot is provided.

Materials Needed
1. Robot
2. Touch Sensor

Robot Specifications
1. The robot must be able to move in a straight line for at least 10 cm.
2. The robot must be able to turn 90 degrees.

1. Place the robot on the table so that the touch sensor is at the 10 cm mark. The robot must be able to move in a straight line for at least 10 cm.

2. Write the program that drives the robot to the other end of the table and back. The robot must be able to move in a straight line for at least 10 cm.

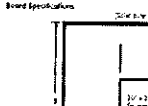

Challenge

Robo 500 Level 2

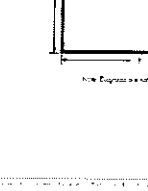

Challenge Description
Write a program that drives a robot from a Touch Sensor to the other end of a table and back. A robot is provided.

Materials Needed
1. Robot
2. Touch Sensor

Robot Specifications
1. The robot must be able to move in a straight line for at least 10 cm.
2. The robot must be able to turn 90 degrees.

1. Place the robot on the table so that the touch sensor is at the 10 cm mark. The robot must be able to move in a straight line for at least 10 cm.

2. Write the program that drives the robot to the other end of the table and back. The robot must be able to move in a straight line for at least 10 cm.

Introduction to Programming/Sensing/Ultrasonic Sensor

The screenshot shows a web interface for the ROBOTC Curriculum. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar on the left with a 'Programming Challenge' menu containing: Wall Detection (Touch), Wall Detection (Ultrasonic), Forward for Distance, Forward Until Dark, Line Tracking, and Volume & Speed. Below the menu is a 'TETRIX Sensing' button. The main content area is titled 'Wall Detection (Ultrasonic)' with the subtitle 'Adapting the Wall Detection behavior to take advantage of the Ultrasonic Sensor'. It features a video player icon labeled 'A Sonic Sojourn', a 'Printable Version' link, and a list of related resources: Thresholds, Robo 500 Challenge (Level 3), Table Bot Challenge (Level 1), RoboMower Challenge (Level 2), and Wall Detection (Ultrasonic) Quiz. A 'Random Numbers' link is also present next to the Table Bot Challenge.

ROBOTC® Curriculum for TETRIX™ & LEGO® MINDSTORMS®

Sensing - Ultrasonic Sensor

The Wall Detection Ultrasonic Sensor Lesson Set builds on what students learned in the Wall Detection Touch Sensor Lesson Set. This Lesson Set teaches students how ultrasonic sensors work, how to measure distance using sound, how to use thresholds to program the ultrasonic sensor, and how to re-configure the motors and sensor setup window. The lesson is also designed to review how programming loops work.

The Sonic Sojourn Video - This video describes how the ultrasonic sensor works.

The Threshold Reference Page - This handout describes what thresholds are, how they are used in programming, and how to calculate them for the ultrasonic sensor.

Random Numbers Reference Page - This handout describes how to write programs that use random number values using ROBOTC.

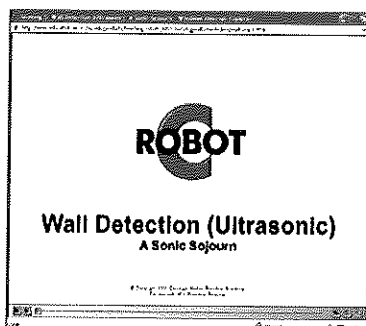

The Ultrasonic Sensor PDF Lesson - A printed version of the video designed to complement the video instruction.

Ultrasonic Programming Challenges - This Lesson Set includes three different programming lessons: The Robo500 Challenge (Level 2), The Table Bot (Level 1) Challenge, and the RoboMower Challenge (Level 2). The challenges are designed so that a teacher can use the same "setup" for multiple challenges. Some challenges get progressively more difficult, while other challenges are designed so that the student completing it is able to quickly solve the same challenge with a different sensor.

Ultrasonic Quiz - Designed to check students understanding of the concept.

Introduction to Programming/Sensing/Ultrasonic Sensor

Sensing - Ultrasonic Sensor Resources

Sensing

Wall Detection A Sonic Sojourn

Robots are great, reliable, and easy to use, but only when they are programmed to do what you want them to do. This is the challenge of programming a robot. The challenge is to make the robot do what you want it to do, and not what you don't want it to do.

One way to do this is to use a sensor. A sensor is a device that can sense the environment around the robot. One type of sensor is an ultrasonic sensor. An ultrasonic sensor can sense the distance to a wall or other object in its field of view.

There are two types of ultrasonic sensors: active and passive. Active sensors emit a sound wave and measure the time it takes to bounce back. Passive sensors only measure the time it takes for a sound wave to bounce back.

There are two types of ultrasonic sensors: active and passive. Active sensors emit a sound wave and measure the time it takes to bounce back. Passive sensors only measure the time it takes for a sound wave to bounce back.

The diagram shows a robot with an ultrasonic sensor. The sensor is emitting a sound wave that is bouncing off a wall. The distance between the robot and the wall is labeled as 'Distance'.

Sensing

Thresholds

Thresholds are values that are used to compare a sensor's output to. If the sensor's output is greater than the threshold, then the robot will do something. If the sensor's output is less than the threshold, then the robot will do something else.

For example, if the sensor's output is the distance to a wall, then the robot could be programmed to turn left if the distance is less than a certain threshold. This would allow the robot to avoid the wall.

The diagram shows a robot with an ultrasonic sensor. The sensor is emitting a sound wave that is bouncing off a wall. The distance between the robot and the wall is labeled as 'Distance'.

One example of a threshold is the distance to a wall. If the distance is less than a certain threshold, then the robot will turn left. This would allow the robot to avoid the wall.

Another example of a threshold is the time it takes for a sound wave to bounce back. If the time is less than a certain threshold, then the robot will do something.

There are many other examples of thresholds. The key is to use them to make the robot do what you want it to do.

Light Value < Dark value - Threshold value

Confusing

Random Numbers

Random numbers are numbers that are chosen at random. They are used in many applications, such as games and simulations.

There are two types of random numbers: pseudo-random and true-random. Pseudo-random numbers are generated by a computer algorithm. True-random numbers are generated by a physical process, such as the decay of a radioactive substance.

The diagram shows a robot with a random number generator. The generator is producing a random number, which is then used to control the robot's movement.

Using Random Numbers

Random numbers are used in many applications. One example is in games. Random numbers can be used to generate random events, such as the appearance of a power-up or the location of an enemy.

Another example is in simulations. Random numbers can be used to simulate random events, such as the movement of particles or the behavior of a stock market.

Using Other Numbers

Random numbers are not the only type of numbers used in programming. Other types of numbers include integers, floats, and strings. Each type of number has its own set of operations and properties.

Integers are whole numbers, either positive or negative. Floats are numbers with a decimal point. Strings are sequences of characters.

Each type of number has its own set of operations and properties. For example, integers can be added, subtracted, multiplied, and divided. Floats can be added, subtracted, multiplied, and divided, but they can also be converted to integers.

Strings can be concatenated, compared, and searched. They can also be converted to integers or floats.

Understanding the different types of numbers and their operations is essential for writing effective programs.

Sensing

Wall Detection (Ultrasonic) Quiz

1. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

2. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

3. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

4. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

5. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

6. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

7. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

8. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

9. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

10. What is the range of an ultrasonic sensor?

a. 0-100 cm
b. 0-500 cm
c. 0-1000 cm
d. 0-2000 cm

Challenge

Robo 500 Level 3

Challenge Description: The robot must travel a path that is 500 units long. The path is made of straight lines and right angles. The robot must travel the path in a continuous loop, starting and ending at the same point.

Materials Needed:

- 1 Robo 500 robot
- 1 Ultrasonic sensor
- 1 Motor
- 1 Battery

Board Specifications:

The board is 500 units long and 500 units wide. It is made of a material that is 1 unit thick. The robot must travel the path in a continuous loop, starting and ending at the same point.

The diagram shows a square path with a central square hole. The path is 500 units long and 500 units wide. The central square hole is 100 units long and 100 units wide.

Challenge

Table Bot Level 1

Challenge Description: The robot must travel a path that is 100 units long and 100 units wide. The path is made of straight lines and right angles. The robot must travel the path in a continuous loop, starting and ending at the same point.

Materials Needed:

- 1 Table Bot robot
- 1 Ultrasonic sensor
- 1 Motor
- 1 Battery

Board Specifications:

The board is 100 units long and 100 units wide. It is made of a material that is 1 unit thick. The robot must travel the path in a continuous loop, starting and ending at the same point.

The diagram shows a square path with a central square hole. The path is 100 units long and 100 units wide. The central square hole is 20 units long and 20 units wide.

Challenge

Robo Mower Level 2

Challenge Description: The robot must travel a path that is 100 units long and 100 units wide. The path is made of straight lines and right angles. The robot must travel the path in a continuous loop, starting and ending at the same point.

Materials Needed:

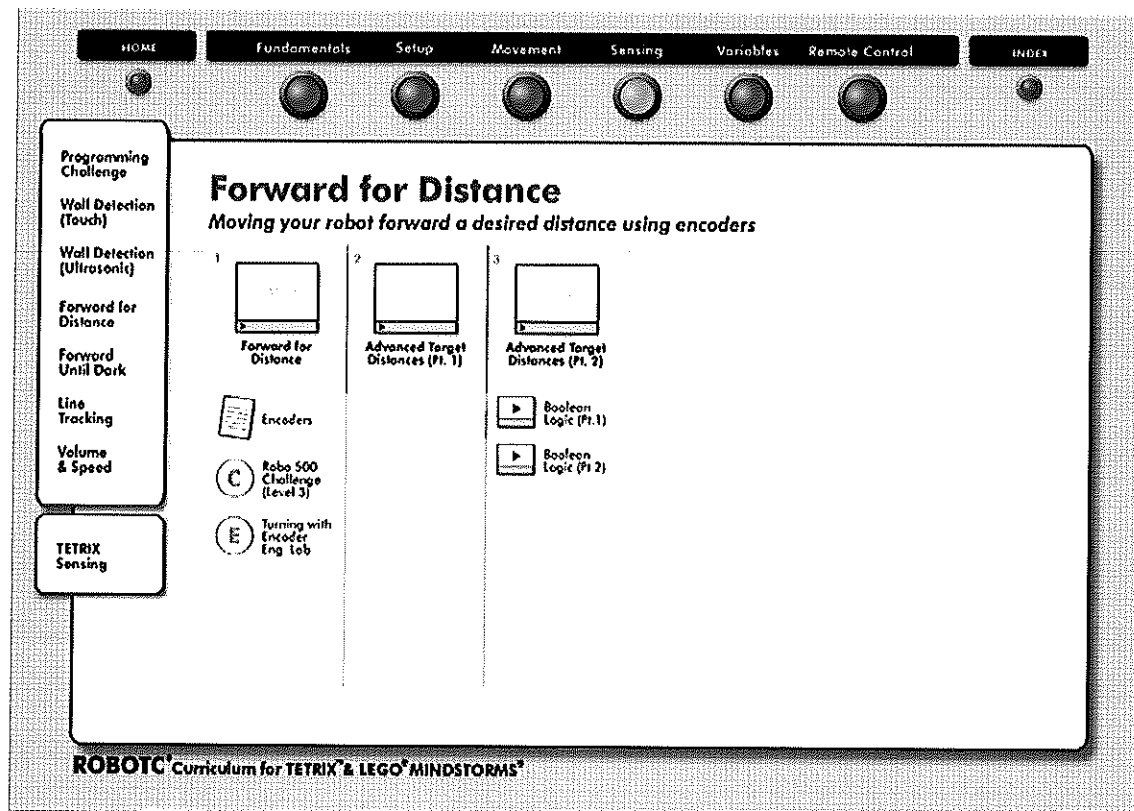

- 1 Robo Mower robot
- 1 Ultrasonic sensor
- 1 Motor
- 1 Battery

Board Specifications:

The board is 100 units long and 100 units wide. It is made of a material that is 1 unit thick. The robot must travel the path in a continuous loop, starting and ending at the same point.

The diagram shows a square path with a central square hole. The path is 100 units long and 100 units wide. The central square hole is 20 units long and 20 units wide.

Introduction to Programming/Sensing/Encoder

Sensing - Encoders

In the Forward for Distance Lesson Set, students learn advanced features of the `nMotorEncoder` function, allowing them to make very precise movements. The NXT smart motors have encoders built into them that allow the robot to move point-to-point in a very accurate manner. In the first video, students learn a simple method of moving point-to-point. In the second and third video set, students learn how to use the `nMotorEncoderTarget` function.

Forward for Distance Video - This lesson teaches students about the encoders built into the NXT smart motors, and the `nMotorEncoder` function.

Advanced Target Distance Part 1 Video - This lesson teaches students about the difference between the `nMotorEncoder` function and the `nMotorEncoderTarget` function. It also explains how the `nMotorEncoderTarget` function is programmed. Students will also learn about a new function that watches the motors "run state".

Advanced Target Distance Part 2 Video - This lesson shows students how to write the `nMotorEncoderTarget` program.

Boolean Logic Videos - Comparison operators and logical operators are key elements that all students must know. This video set is included at several spots throughout the curriculum for student review.

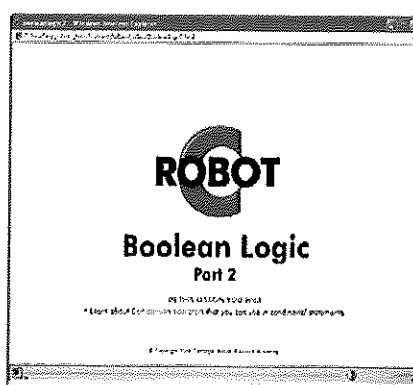

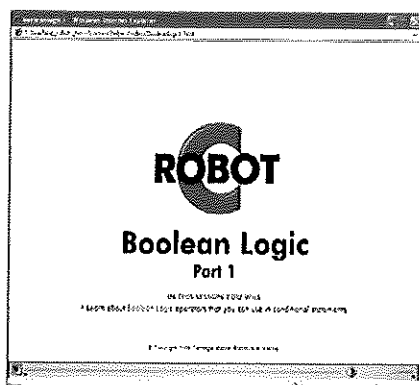

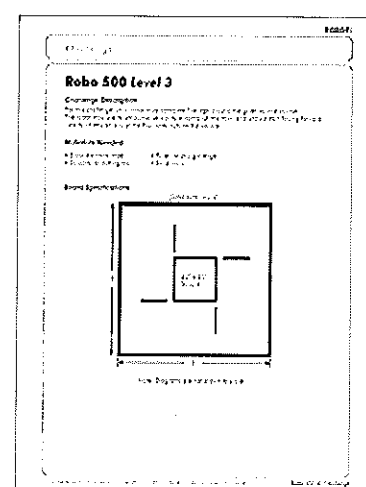

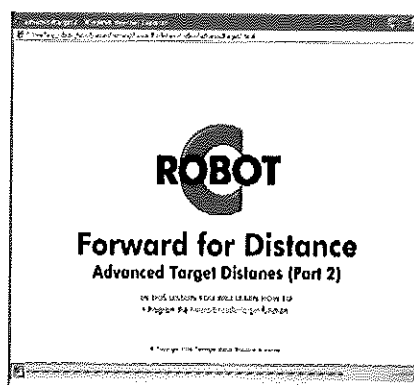

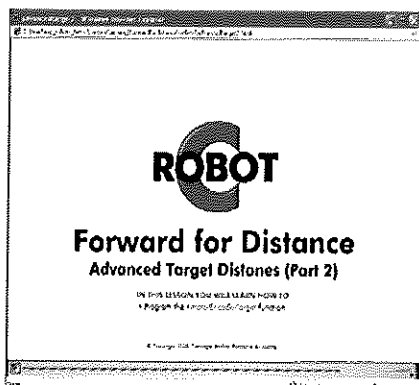

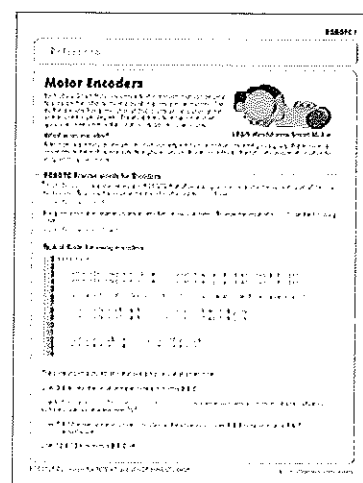

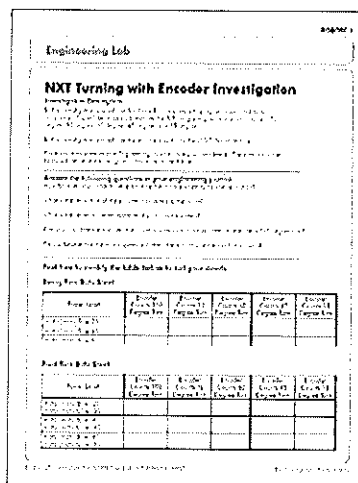

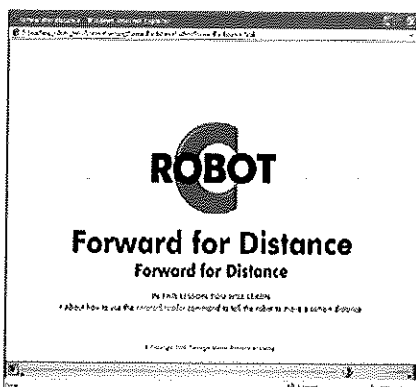

Encoders Reference Page - The encoders reference page is a handout that can be used as a reference or study guide.

Turning with Encoder Engineering Lab - The Encoder Engineering Lab has students calculate encoder counts to turn specific angles. This data will help them with all programming moving forward.

The Robo500 (Level3) Programming Challenge - Students have seen this challenge before. Now they will be able to apply what they've learned in the encoder lessons to solve the problem more perfectly.

Introduction to Programming/Sensing/Encoder

Sensing - Encoder Resources

Introduction to Programming/Sensing/Light Sensor

The screenshot shows a web interface for the ROBOTC Curriculum. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar with a list of programming challenges: Programming Challenge, Wall Detection (Touch), Wall Detection (Ultrasonic), Forward for Distance, Forward Until Dark, Line Tracking, and Volume & Speed. A 'TETRIX Sensing' button is also present. The main content area is titled 'Forward Until Dark' with the subtitle 'Moving until the Light Sensor detects a dark surface'. It features three numbered steps: 1. The Light Sensor, 2. Thresholds 201, and 3. Wait for Dark. To the right of these steps are several challenge icons: Robo 500 Challenge (Level 4), Minesweeper Challenge, Table Bot Challenge (Level 2), Random Numbers, Line Runner Challenge (Level 1), Firefly Challenge (Level 1), and Forward Until Dark Quiz. A 'Printable Version' button is in the top right corner. At the bottom of the page, it says 'ROBOTC® Curriculum for TETRIX® & LEGO® MINDSTORMS®'.

Sensing - Light Sensor

The Forward Until Dark Lesson Set introduces students to how the light sensor works, how to troubleshoot programs that use the light sensor, and how to calculate threshold values for light sensors. The Lesson Set has the following resources:

The Light Sensor Video - The light sensor video reviews how the touch and ultrasonic sensors work and then describes how the LEGO light sensor works. The video also describes things to consider to optimize how the sensor works.

The Thresholds 201 Video - This lesson describes how to calculate thresholds for the light sensor. It also demonstrates the physical steps that a programmer needs to do to calculate a light sensor threshold value.

The Wait for Dark Video - This lesson begins with a prior program, then adapts the program to use the light sensor. Students will learn how to configure the Motors and Setup Configuration menu for the light sensor, and then are given directions that allow them to complete the program.

The Threshold and Random Numbers Reference Pages - These handouts are the same handouts used in the previous lesson and are useful to students still learning these foundational programming concepts.

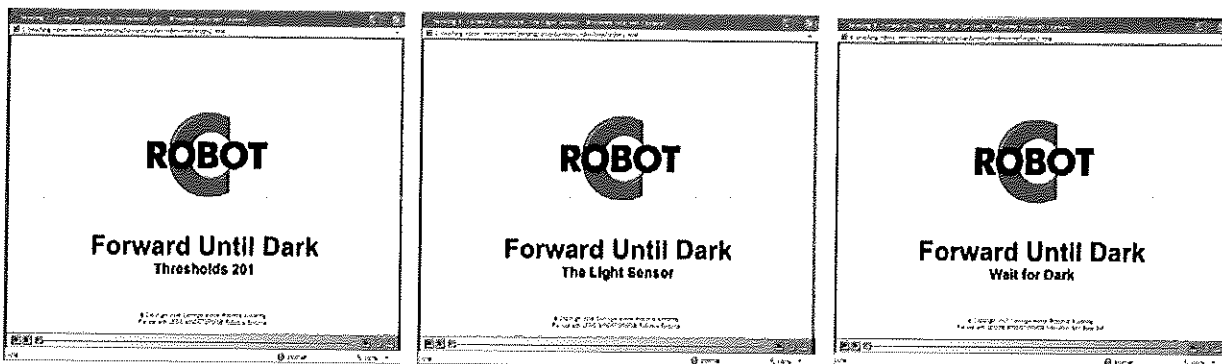

The Forward Until Dark Printable PDF - This document is a printed version of the three video lessons in the Forward Until Dark Lesson Set.

The Programming Challenges - There are five programming challenges with this lesson: The Robo500 Challenge (Level4), the Table Bot Challenge (Level 2), the Line Runner Challenge (Level1), the Minesweeper Challenge, and the Firefly Challenge (Level1). All students may not complete all programming challenges.

Forward Until Dark Lesson Set Quiz - A quiz to check student's understanding.

Introduction to Programming/Sensing/Light Sensor

Sensing - Light Sensor Resources

Sensing

Forward Until Dark Light Sensor

In this lesson, you will learn how the Light Sensor works and how it is used to control a robot's movement.

Hardware:

- 1x Light Sensor
- 1x Motor
- 1x Battery
- 1x Robot

Software:

- 1x ROBOTC
- 1x Light Sensor

Board Specifications:

- 1x Light Sensor
- 1x Motor
- 1x Battery
- 1x Robot

Challenge

Line Runner Level 1

Challenge Description: Design a robot that can follow a line on a black surface. The robot should be able to follow a line that is 1/2 inch wide and 1/4 inch high. The robot should be able to follow a line that is 1/2 inch wide and 1/4 inch high. The robot should be able to follow a line that is 1/2 inch wide and 1/4 inch high.

Materials Needed:

- 1x Light Sensor
- 1x Motor
- 1x Battery
- 1x Robot

Board Specifications:

- 1x Light Sensor
- 1x Motor
- 1x Battery
- 1x Robot

Challenge

Minesweeper

Challenge Description: Design a robot that can find a mine in a 5x5 grid. The robot should be able to find a mine that is 1/2 inch wide and 1/4 inch high. The robot should be able to find a mine that is 1/2 inch wide and 1/4 inch high. The robot should be able to find a mine that is 1/2 inch wide and 1/4 inch high.

Materials Needed:

- 1x Light Sensor

Introduction to Programming/Sensing/Light Sensor/LineTracking

The screenshot shows a web interface for the ROBOTC Curriculum. At the top is a navigation bar with buttons: HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar on the left with a list of topics: Programming Challenge, Wall Detection (Touch), Wall Detection (Ultrasonic), Forward for Distance, Forward Until Dark, Line Tracking, Volume & Speed, and TETRIX Sensing. The main content area is titled "Line Tracking" with the subtitle "Expanding your robot's decision-making repertoire to allow more complex behaviors". It features a "Printable Version" link. The content is organized into five numbered columns, each representing a lesson: 1. Line Tracking (Basic), 2. Line Tracking (Better), 3. Line Tracking (Timer), 4. Line Tracking (Rotation, Pt. 1), and 5. Line Tracking (Rotation, Pt. 2). Below these columns are icons for various challenges: If-Else Statement, Switch-Case Statement, MouseBot Challenge, Timers, Minefield Challenge (Level 1), RoboC Challenge (Level 2), and Line Tracking Quiz.

Sensing - Light Sensor LineTracking

The Line Tracking Lesson Set breaks line tracking, a seemingly complex behavior, into a set of simple robot behaviors. It introduces students to a new structure, the if-else structure. Students learn to use multiple sensor feedback when they first use feedback from internal timers and light sensors to control how far their robot moves. Once they solve that problem, they then use feedback from the NXT smart motors and the light sensor to determine how far their robot travels. At the end of this Lesson Set, students will have all of the tools that they need to complete the obstacle course challenge. This Lesson Set uses the following video resources:

The Line Tracking (Basic) Video - This video teaches students how line tracking works, and how to break complex behaviors into simple behaviors. It also introduces the students to a naive way to solve the line track programming problem using while loops. This solution works, but has serious limitations.

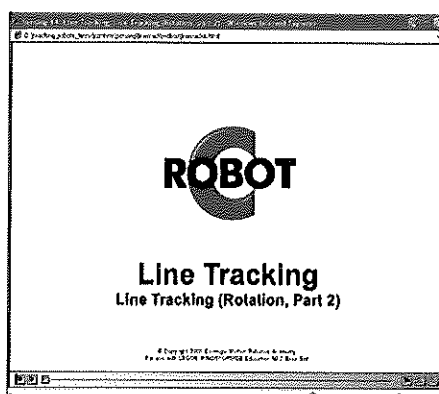

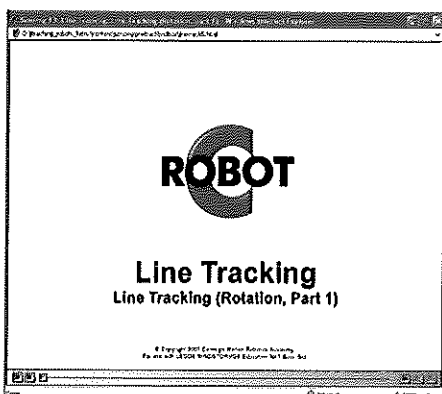

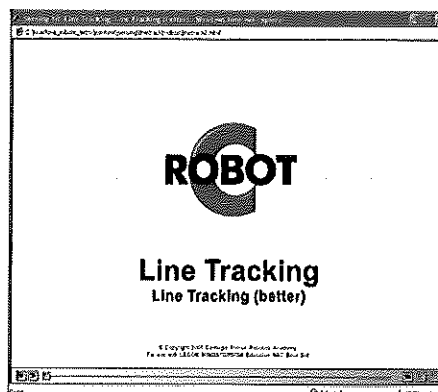

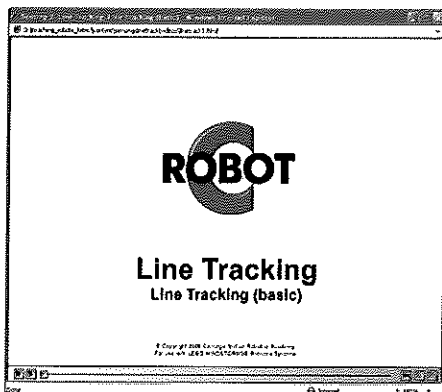

Line Tracking (Better) Video - This lesson teaches students how to use feedback from multiple sensors with their robot. They discover that their naive solution using only "while loops" doesn't always work. The video explains if/else structures, explaining the code as it talks students through the solution.

The Line Track Timer Video - This video teaches students how to use the internal timers built into the NXT to control how long the robot does something. This is a very valuable tool that the student will be able to use in many other situations.

The Line Tracking Rotation Parts 1 & 2 Videos - Teaches the student to use feedback from the encoders built into the NXT smart motors to determine when to stop tracking a line.

Introduction to Programming/Sensing/Light Sensor/LineTracking

Sensing - Light Sensor LineTracking Video Resources

Sensing - Light Sensor LineTracking Print Resources

If-Else Reference Page - Students will use the if-else structure from this point forward in their programming career. This is a one page reference sheet that shows them how it works.

Switch Case Statement - Another option for programmers that have to control multiple conditions is the switch case. This resource is a multi-page handout that students can reference when using switch cases.

Timer Reference Page - The timer reference page demonstrates specific reserved words used in ROBOTC to control the internal timers built into the NXT.

Line Tracking Programming Challenges - This Lesson Set includes three open-ended challenges designed to support the lesson: the MouseBot Challenge, the Minefield Challenge (Level1), and the Robocci Challenge (Level2). All students may not complete every programming challenge.

Line Track Quiz - The line track quiz is included to check student's understanding.

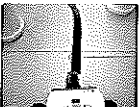

Introduction to Programming/Sensing/Light Sensor/LineTracking

Sensing - Light Sensor LineTracking Print Resources

Knowledge

Line Tracking Basic Lesson

Have your students build a line of the robot's light sensor to track a line on a surface. The sensor will detect the line and the robot will follow it. The robot will follow the line by adjusting the motor's speed to keep the line in the center of the sensor's field of view.

Build your robot
The robot's light sensor is used to detect the line. The robot's motor is used to move the robot along the line.

Follow the line
The robot's light sensor is used to detect the line. The robot's motor is used to move the robot along the line.

Follow the line
The robot's light sensor is used to detect the line. The robot's motor is used to move the robot along the line.

Follow the line
The robot's light sensor is used to detect the line. The robot's motor is used to move the robot along the line.

Reference

If-else Statement

An if-else statement is a control structure that allows a program to execute different blocks of code based on a condition. The condition is a boolean expression that evaluates to either true or false. If the condition is true, the code block following the if statement is executed. If the condition is false, the code block following the else statement is executed.

```

if (condition) {
  // Code to execute if condition is true
} else {
  // Code to execute if condition is false
}

```

Follow the line
The robot's light sensor is used to detect the line. The robot's motor is used to move the robot along the line.

Follow the line
The robot's light sensor is used to detect the line. The robot's motor is used to move the robot along the line.

Follow the line

Switch Case

A switch case statement is a control structure that allows a program to execute different blocks of code based on a condition. The condition is a boolean expression that evaluates to either true or false. If the condition is true, the code block following the switch statement is executed. If the condition is false, the code block following the case statement is executed.

```

switch (condition) {
  case 1:
    // Code to execute if condition is 1
    break;
  case 2:
    // Code to execute if condition is 2
    break;
  default:
    // Code to execute if condition is not 1 or 2
}

```

Follow the line
The robot's light sensor is used to detect the line. The robot's motor is used to move the robot along the line.

Follow the line

Reference

Timers

Timers are used to measure the time taken for a program to execute a block of code. The timer is a variable that stores the time taken for the program to execute the block of code. The timer is used to measure the time taken for the program to execute the block of code.

```

// Timer variable
int timer = 0;

// Timer function
void timerFunction() {
  timer++;
}

// Timer usage
timerFunction();

```

Challenge

Minefield Level 1

Challenge Description
The robot must navigate a minefield of obstacles. The robot must avoid the obstacles and reach the goal. The robot must avoid the obstacles and reach the goal.

Materials Needed
• Robot
• Light sensor
• Motor
• Timer
• Switch case statement
• If-else statement
• Timer function
• Timer variable
• Timer usage
• Timer increment
• Timer decrement

Robot Specifications
The robot must be able to navigate a minefield of obstacles. The robot must avoid the obstacles and reach the goal. The robot must avoid the obstacles and reach the goal.

1. Follow the line of the minefield.

2. Avoid the obstacles.

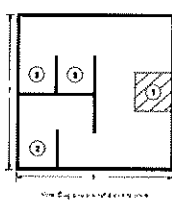

Challenge

Mousebot

Challenge Description
The robot must navigate a maze. The robot must avoid the walls and reach the goal. The robot must avoid the walls and reach the goal.

Materials Needed
• Robot
• Light sensor
• Motor
• Timer
• Switch case statement
• If-else statement
• Timer function
• Timer variable
• Timer usage
• Timer increment
• Timer decrement

Robot Specifications
The robot must be able to navigate a maze. The robot must avoid the walls and reach the goal. The robot must avoid the walls and reach the goal.

1. Follow the line of the maze.

2. Avoid the walls.

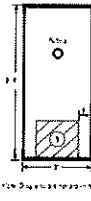

Challenge

Robot Level 2

Challenge Description
The robot must navigate a complex environment. The robot must avoid the obstacles and reach the goal. The robot must avoid the obstacles and reach the goal.

Materials Needed
• Robot
• Light sensor
• Motor
• Timer
• Switch case statement
• If-else statement
• Timer function
• Timer variable
• Timer usage
• Timer increment
• Timer decrement

Robot Specifications
The robot must be able to navigate a complex environment. The robot must avoid the obstacles and reach the goal. The robot must avoid the obstacles and reach the goal.

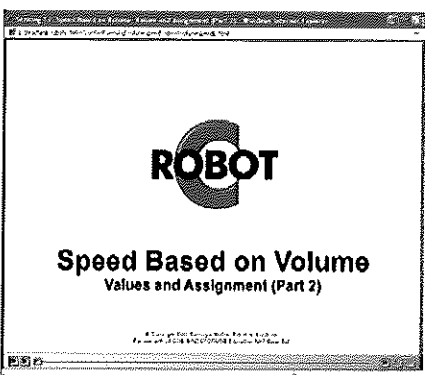

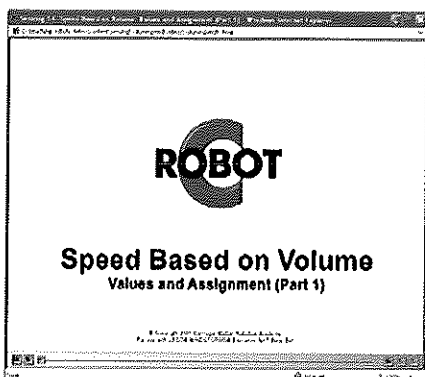

1. Follow the line of the environment.

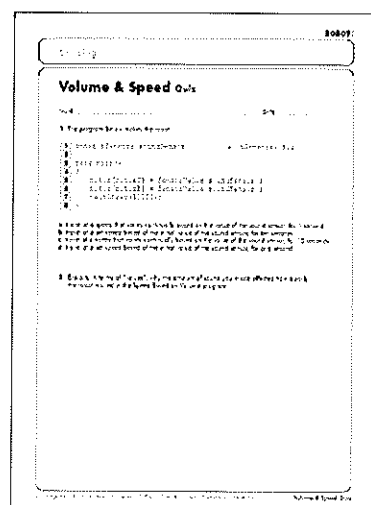

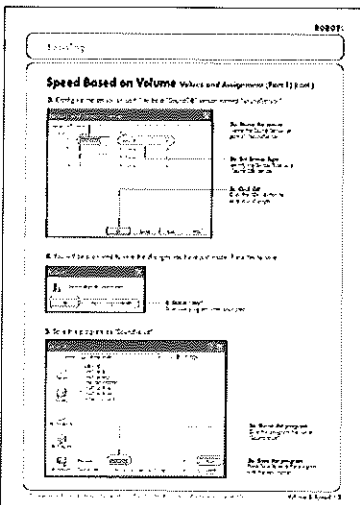

2. Avoid the obstacles.

Introduction to Programming/Sensing/Sound Sensor

Sensing - Sound Sensor

In the Speed Based on Sound Lesson Set, students are challenged to map the values of the sound sensor to the motor powers so that they can control the motors speed based on sound. This lesson reinforces the idea that a programmer needs to continually update the sensor value if they want to use the sensor value to control something real time. This is a very important concept that beginning programmers often miss. In this lesson, students also practice using the internal timers and the reserved words that are associated with it. The Lesson Set includes: two videos, a 9 page PDF that aligns with the video, and a quiz.

VARIABLES and FUNCTIONS

Counting, calculating, and multiplying your programming power

Complex tasks and environments require your robot to keep track of more than just what it can see of a given moment. Storing information, and performing calculations with the data allow your robot to be more independent and aware of its overall situation.

You will also investigate ways to increase your programming power by encapsulating behaviors in functions, and using variable parameters to let one behavior do the work of many.

Unit Preview

- Learn to store values for later use by using variables
- Perform calculations on variables to derive other important values
- Use variables to track (count) occurrences of important events
- Use stored or calculated values to control behaviors
- Identify patterns across behaviors, and create functions that can take advantage of their similarities

ROBOTC Curriculum for TETRIX™ & LEGO® MINDSTORMS®

Sensing - Variables and Functions

The Variables and Functions Unit contains four Lesson Sets: Automatic Thresholds, Line Counting, Patterns of Behaviors and Debugging. Each of these Lesson Sets teaches a major programming concepts. Automatic Thresholds introduces the concept of variables, variable types, how to name variables, and how to manipulate them. The Line Counting Lesson Set builds on the variable concept and teaches students how they can manipulate the value of variables. Patterns of Behaviors introduces functions, how to pass parameters in functions, and how functions can be used to simplify programs. And finally, the Debugging Lesson Set, offers two lessons on how to use ROBOTC's debugger to troubleshoot programs.

The previous programming units, Movement and Sensing, introduce basic robot programming concepts. These lessons begin to introduce basic programming concepts!

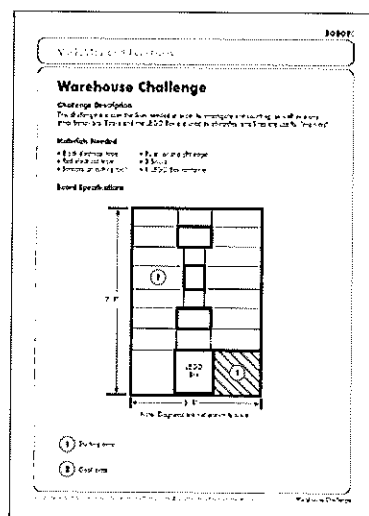

Programming/Variables and Functions/Programming Challenge

The screenshot shows the ROBOTC Curriculum website interface. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar with a vertical menu containing: Programming Challenge, Automatic Thresholds, Line Counting, Patterns of Behavior, Debugging, and TETRIS Engineering Challenge. The main content area is titled "Programming Challenge" with the subtitle "Working with data and encapsulating behaviors in functions". It features a large graphic of a warehouse floor plan with a robot icon and a "Warehouse Challenge" label. Below the graphic is a "Solution Video" button. At the bottom of the page, it says "ROBOTC Curriculum for TETRIS & LEGO MINDSTORMS".

Sensing - Variables and Functions/Programming Challenge

The Warehouse Programming Challenge asks students to develop a customizable program that allows them to program their robot to move to any spot in the warehouse. As students move through the Automatic Thresholds, Line Counting and Patterns of Behavior Lesson Sets they will gain the skills needed to solve the programming challenge.

There are two resources available to introduce the programming challenge: *the Warehouse Challenge PDF* and *the Warehouse Challenge Solution Video*.

ROBOTC® Curriculum for TETRIX™ & LEGO® MINDSTORMS®

Sensing - Variables and Functions/Automatic Thresholds

The Automatic Thresholds Lesson Set introduces a variables; a very large concept in computer programming. The step-by-step guided lesson will allow students to solve this programming problem, but the concept will need to be revisited multiple times before students become competent using variables.

Values & Variable Video - This video introduces variables, variable types, and how to name variables.

Variables and Thresholds Video - This video reviews how to calculate thresholds for the light sensor, the programming problem that students will solve in this Lesson Set, and defines the initial variables used to solve this problem.

Programming with Variables Video - This video walks students through the automatic threshold calculation problem beginning with configuring the light and touch sensor and continuing through the initial setup of the problem.

Variables and the Debugger Video - This video shows students how to use ROBOTC's debugger to find the problem in their initial programming solution. They will discover how fast computer processors work, and be shown a solution.

Threshold Calculations Video - This video shows students how to do calculations using variables and how to display values to the NXT display screen.

The Boolean Logic Video Set - Students have seen this set in an earlier lesson; this is a good time to review.

Variable and Data Types Reference - This is a multiple page handout that students can use as a study guide.

Threshold Values Reference - One page reference guide that students can use to review threshold values.

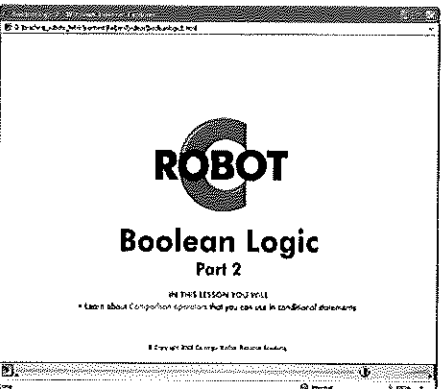

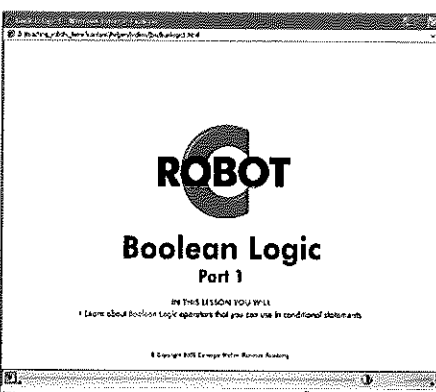

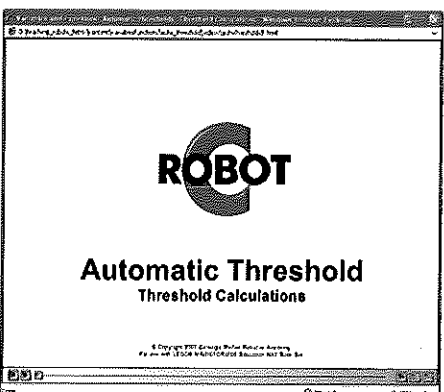

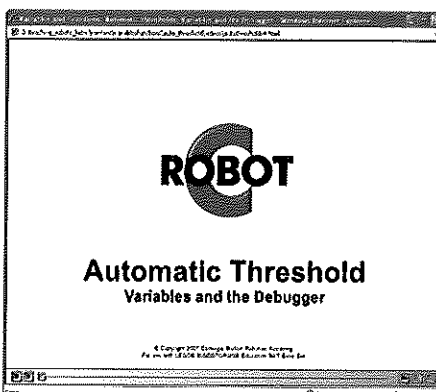

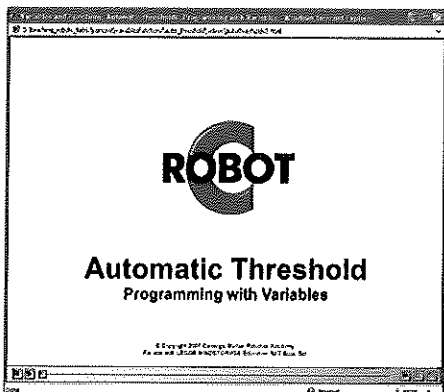

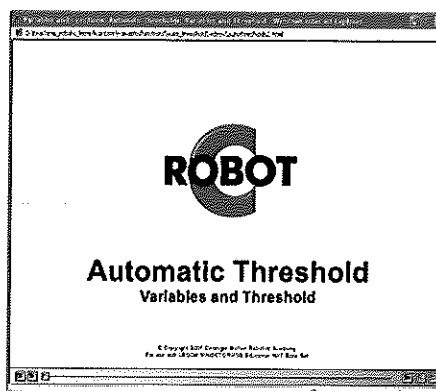

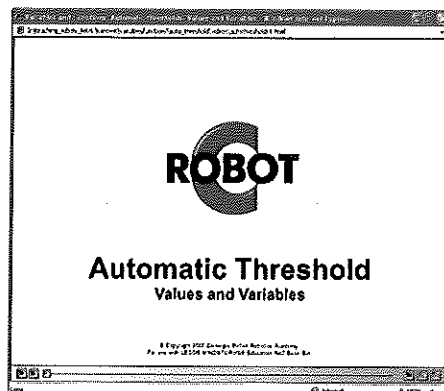

Display Text Reference - This multiple page lesson shows students step-by-step how to display text on their screens.

Firefly Challenge (Level 2) - This challenge requires students to find a light value and report the value to their screen.

Automatics Thresholds PDF - A 36 page PDF that covers what was taught in the video lessons in a print format.

Programming/Variables and Functions/Counting

The screenshot shows a web interface for the ROBOTC Curriculum. At the top is a navigation bar with buttons: HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar with a list of topics: Programming Challenge, Automatic Thresholds, Line Counting (highlighted), Patterns of Behavior, Debugging, and TETRIX Engineering Challenge. The main content area is titled 'Line Counting' with the subtitle 'Controlling behaviors with values collected over time'. It features five numbered steps: 1. Counting, 2. Line Counting (Part 1), 3. Line Counting (Part 2), 4. Line Counting (Part 3), and 5. Line Counting (Part 4). To the right of these steps are icons for various challenges: PipeBot Challenge (Level 1), Quick Tap Challenge, PipeBot Challenge (Level 2), Line Runner Challenge (Level 2), Auto Attendance Challenge, and Line Counting Quiz. A 'Printable Version' icon is also present in the top right corner of the main content area. At the bottom of the page, it says 'ROBOTC Curriculum for TETRIX & LEGO MINDSTORMS'.

Sensing - Variables and Functions/Counting

The Line Counting Lesson Set introduces students to using variable to store values so that their robots can count. It appears that this would be a very simple task to implement, but there are multiple small problems to consider. Students will learn more about processors and implications of processing speed that they may not have thought about. Students will learn to setup a counter variable, when to count, how to count, and how to stop counting in a program.

The Counting Video - This video introduces students to reassigning values to variables allowing the robot to count.

Line Counting Part 1 Video - This video helps student to identify the problem as well begin to write their code.

Line Counting Part 2 Video - This video introduces students to using the "breakpoint" function built into ROBOTC's debugger allowing students to see how fast the robot's processor loops.

Line Counting Part 3 Video - Students are shown how to create a set of variables and turn them on and off helping them to count or not count at the correct spots in their program.

Line Counting Part 4 Video - The last video in the Lesson Set shows students how they can control when the robot stops.

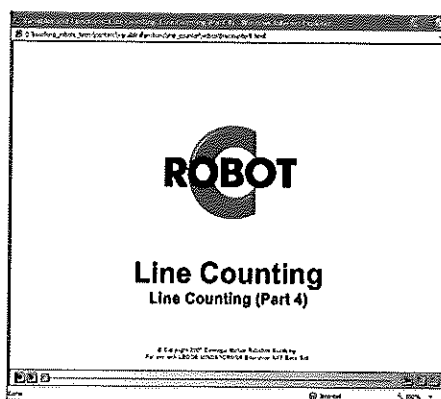

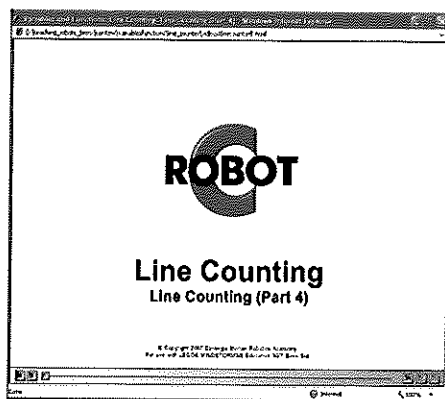

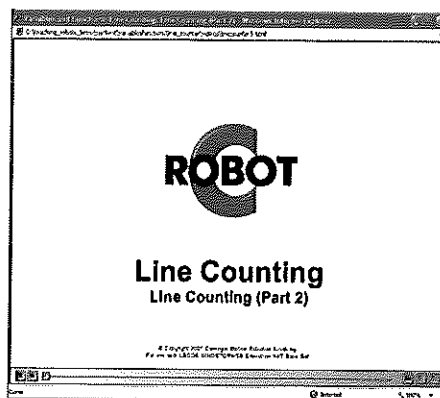

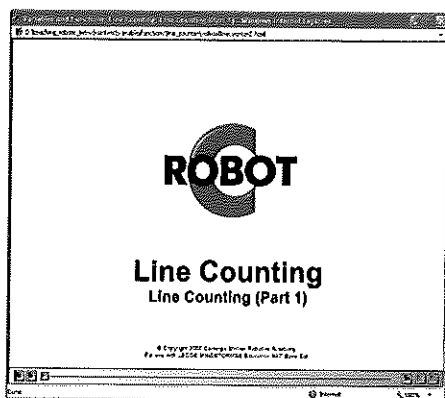

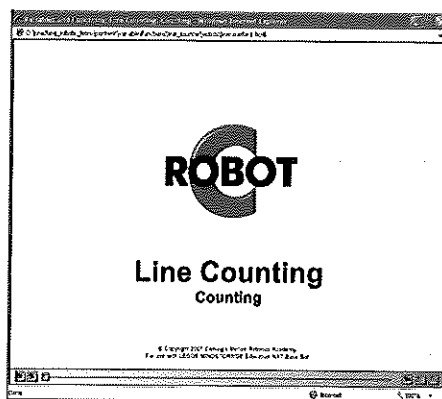

Line Counting PDF Lesson Set - A printed version of everything that was found in the Line Counting video lessons.

Programming Challenges - Students will begin to separate at this point. There are five programming challenges included in this Lesson Set. The programming challenges are more difficult at this point and not every student will complete every challenge. The challenges are: PipeBot Challenge (Level1), Quick Tap Challenge, The Pipe Bot Challenge (Level2), the Line Runner Challenge (Level 2), and the Auto Attendance Challenge.

Line Counting Lesson Set Quiz - A quiz designed to check students understanding of these concepts.

Line Counting.c

Ques. :- Write a program to find the sum of first 1000 natural numbers.

```

#include <stdio.h>
#define N 1000
int main()
{
    int sum = 0;
    for (int i = 1; i <= N; i++)
    {
        sum += i;
    }
    printf('Sum of first %d numbers is: %d\\n', N, sum);
    return 0;
}

```

Ans. :-

Output :-

Sum of first 1000 numbers is: 500500

Explain :- In this program, we have defined a constant `N` as 1000. We use a `for` loop to iterate from 1 to `N`, adding each number to the `sum` variable. Finally, we print the sum using `printf`.

PlatoBot Level 1

Challenge Description
 Build and program a robot which can travel through a maze and deliver the flag inside contained in PlatoBot. Each maze should be contained and placed in a suitable wall type. Attached to the bottom of the wall of the program.

Materials Needed

- 1 Black infrared laser
- 1 Red infrared laser
- 1 Infrared sensor unit
- 1 2" diameter plastic pipe (length) 10" long
- 1 1/2" x 1/2" x 1/2" pipe (height)

Board Specifications

Programming/Variables and Functions/Patterns of Behaviors

The screenshot shows a web interface for the ROBOTC Curriculum. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar with a list of topics: Programming Challenge, Automatic Thresholds, Line Counting, Patterns of Behavior (highlighted), and Debugging. Below the sidebar is a 'TETRIX Engineering Challenge' button. The main content area is titled 'Patterns of Behavior' with the subtitle 'Representing behaviors simply and powerfully using functions'. It features a 'Printable Version' button and a grid of five lesson cards: 1. Behaviors, 2. Creating and Using Functions (with a 'Functions' icon), 3. Variables & Functions (Pt. 1) (with a 'Global Variables' icon), 4. Variables & Functions (Pt. 2) (with a 'Robot Acceleration Challenge' icon), and 5. Variables & Functions (Pt. 3) (with a 'Minefield Challenge (Level 2)' and 'Patterns of Behavior Quiz' icon). At the bottom of the page, it says 'ROBOTC® Curriculum for TETRIX™ & LEGO® MINDSTORMS®'.

Sensing - Variables and Functions/Patterns of Behaviors

In the Patterns and Behaviors Lesson Set students learn to program using functions. Functions are very powerful organizers used by programmers that program robots using behavior based programming strategies.

Behaviors Video - Introductory video that explains the value of programming using functions.

Creating and Using Functions Video - In this video students learn the relationship between task main and a function. They learn to declare functions and use them in the task main section of their program.

Variables and Functions Part 1 Video - In this video students learn how to take code from other programs and turn them into functions and then they will take those functions and use them in an easier to read program. They also learn about the scope of variables and how to create global variables.

Variables and Functions Part 2 Video - In this video students continue to write the solution to the "warehouse" challenge using their newly found function tool.

Variables and Functions Part 3 Video - In this video students learn to pass parameters making their functions much more powerful.

Functions Reference Guide - This is a multipage handout that shows students how functions work.

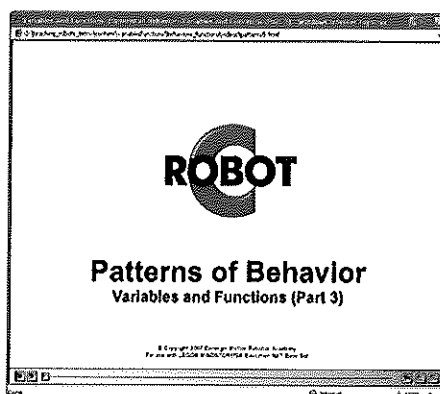

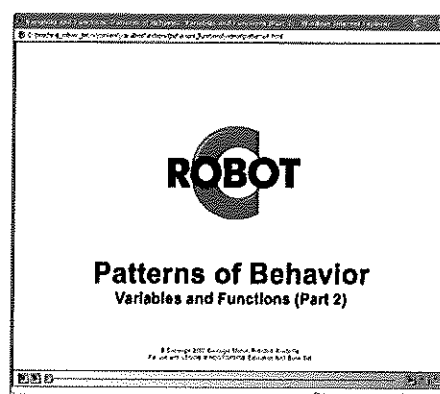

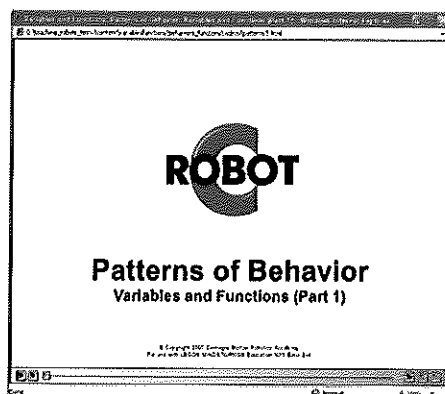

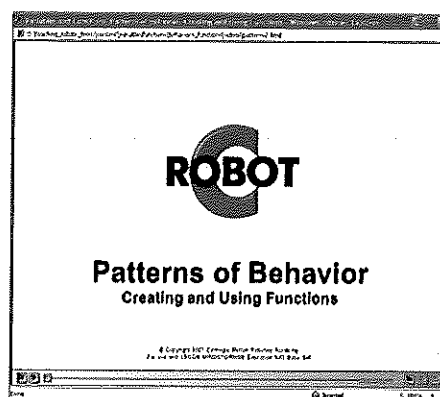

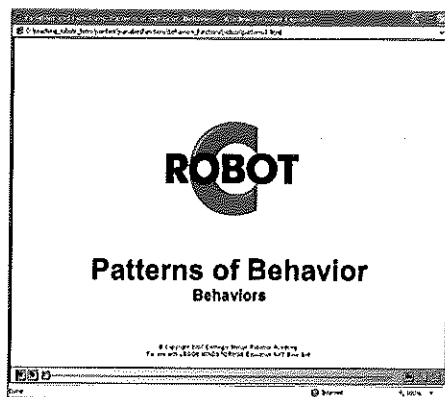

Global Variables Reference Guide - This handout explains what a global variable is and how it can be used.

Programming Challenges - This Lesson Set include two advanced programming challenges: the Robot Acceleration Challenge, and the Minefield Challenge (Level2).

The Patterns of Behaviors Lesson Set Handout - This is a 40 page PDF that complements the videos in this Lesson Set.

RobotC

Patterns of Behavior Behaviors

In this lesson, you will learn how to use the patterns of behavior to control the robot's movement.

A pattern of behavior is a sequence of actions that the robot performs in a specific order. It is used to control the robot's movement in a specific way.

Example: A robot moves forward until it reaches a wall, then it turns right and moves forward again.

Code:

```

// Move forward until a wall is detected
while (true) {
  motor[1] = 100;
  motor[2] = 100;
  if (sonar[0] < 10) {
    motor[1] = 0;
    motor[2] = 0;
    wait(1000);
    motor[1] = 100;
    motor[2] = 100;
    turnRight();
  }
}
  
```

Notes: The robot will move forward until it reaches a wall, then it will turn right and move forward again. The robot will continue to move forward until it reaches a wall, then it will turn right and move forward again.

RobotC

Patterns of Behavior o/s

In this lesson, you will learn how to use the patterns of behavior to control the robot's movement.

A pattern of behavior is a sequence of actions that the robot performs in a specific order. It is used to control the robot's movement in a specific way.

Example: A robot moves forward until it reaches a wall, then it turns right and moves forward again.

Code:

```

// Move forward until a wall is detected
while (true) {
  motor[1] = 100;
  motor[2] = 100;
  if (sonar[0] < 10) {
    motor[1] = 0;
    motor[2] = 0;
    wait(1000);
    motor[1] = 100;
    motor[2] = 100;
    turnRight();
  }
}
  
```

Notes: The robot will move forward until it reaches a wall, then it will turn right and move forward again. The robot will continue to move forward until it reaches a wall, then it will turn right and move forward again.

RobotC

Global Variables

In this lesson, you will learn how to use global variables to control the robot's movement.

A global variable is a variable that is declared outside of a function and can be accessed by any function in the program.

Example: A robot moves forward until it reaches a wall, then it turns right and moves forward again.

Code:

```

// Global variable for the robot's position
int position = 0;

// Move forward until a wall is detected
while (true) {
  motor[1] = 100;
  motor[2] = 100;
  if (sonar[0] < 10) {
    motor[1] = 0;
    motor[2] = 0;
    wait(1000);
    motor[1] = 100;
    motor[2] = 100;
    turnRight();
  }
}
  
```

Notes: The robot will move forward until it reaches a wall, then it will turn right and move forward again. The robot will continue to move forward until it reaches a wall, then it will turn right and move forward again.

RobotC

Functions

In this lesson, you will learn how to use functions to control the robot's movement.

A function is a block of code that is used to perform a specific task. It is called by the program and returns a value.

Example: A robot moves forward until it reaches a wall, then it turns right and moves forward again.

Code:

```

// Function to move forward until a wall is detected
void moveForward() {
  while (true) {
    motor[1] = 100;
    motor[2] = 100;
    if (sonar[0] < 10) {
      motor[1] = 0;
      motor[2] = 0;
      wait(1000);
      motor[1] = 100;
      motor[2] = 100;
      turnRight();
    }
  }
}

// Call the function
moveForward();
  
```

Notes: The robot will move forward until it reaches a wall, then it will turn right and move forward again. The robot will continue to move forward until it reaches a wall, then it will turn right and move forward again.

RobotC

Challenge: Minefield Level 2

In this challenge, you will learn how to use the patterns of behavior to control the robot's movement.

A pattern of behavior is a sequence of actions that the robot performs in a specific order. It is used to control the robot's movement in a specific way.

Example: A robot moves forward until it reaches a wall, then it turns right and moves forward again.

Code:

```

// Move forward until a wall is detected
while (true) {
  motor[1] = 100;
  motor[2] = 100;
  if (sonar[0] < 10) {
    motor[1] = 0;
    motor[2] = 0;
    wait(1000);
    motor[1] = 100;
    motor[2] = 100;
    turnRight();
  }
}
  
```

Notes: The robot will move forward until it reaches a wall, then it will turn right and move forward again. The robot will continue to move forward until it reaches a wall, then it will turn right and move forward again.

RobotC

Challenge: Robot Acceleration

In this challenge, you will learn how to use the patterns of behavior to control the robot's movement.

A pattern of behavior is a sequence of actions that the robot performs in a specific order. It is used to control the robot's movement in a specific way.

Example: A robot moves forward until it reaches a wall, then it turns right and moves forward again.

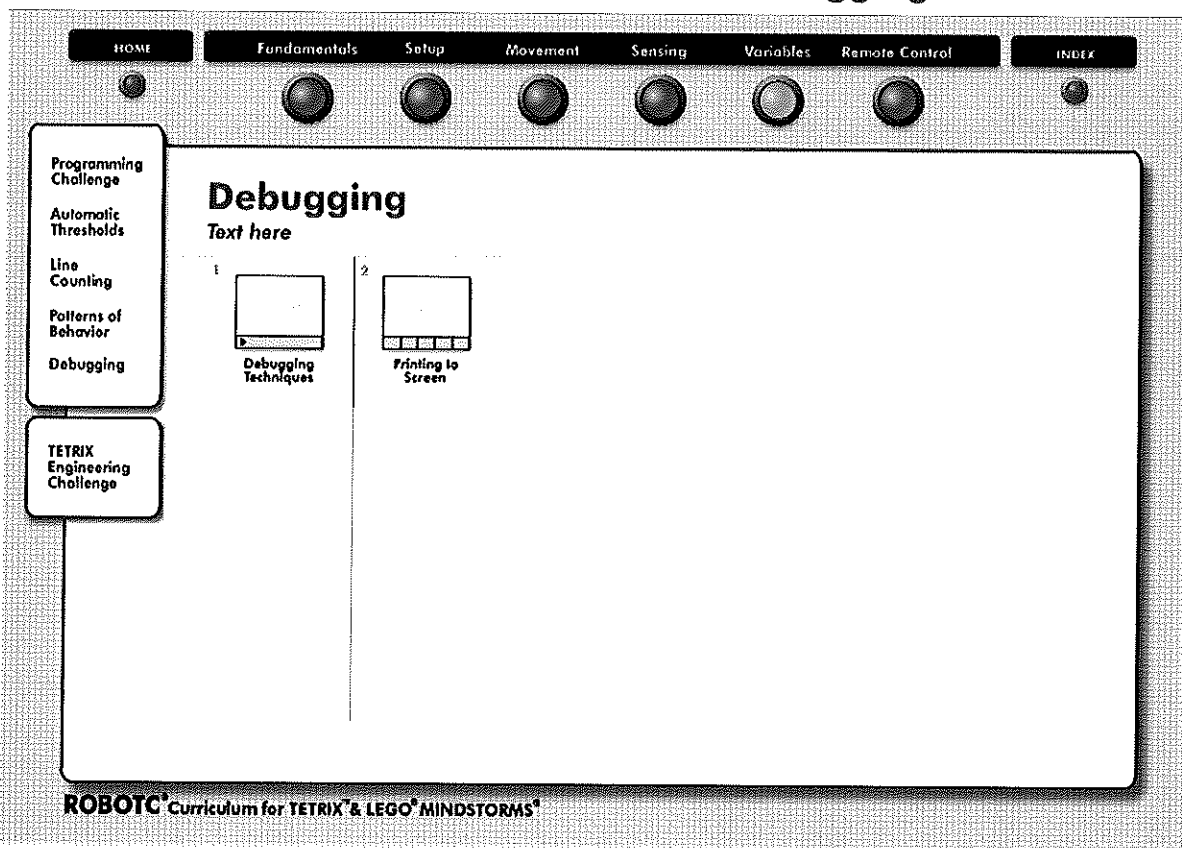

Code:

```

// Move forward until a wall is detected
while (true) {
  motor[1] = 100;
  motor[2] = 100;
  if (sonar[0] < 10) {
    motor[1] = 0;
    motor[2] = 0;
    wait(1000);
    motor[1] = 100;
    motor[2] = 100;
    turnRight();
  }
}
  
```

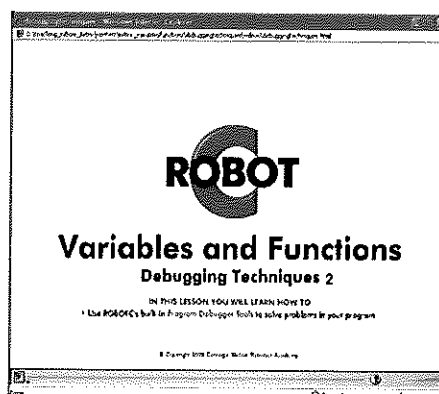

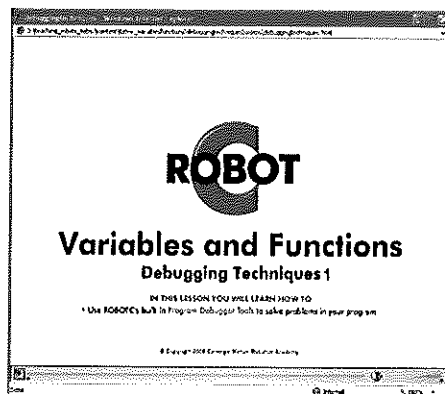

Notes: The robot will move forward until it reaches a wall, then it will turn right and move forward again. The robot will continue to move forward until it reaches a wall, then it will turn right and move forward again.

Programming/Variables and Functions/Debugging

Sensing - Variables and Functions/Debugging

The Debugging Lesson Set consists of a set of videos designed to highlight ROBOTC's debugging screen. The first video, Debugging Techniques has the student open up a sample program that shows them how to open up the expert mode to use the higher level debugging tools available through ROBOTC. Students will learn how to use the step into, step over, step out, breakpoint, and clear all features found on the debug start menu. The second video set, Printing to Screen, highlights the advantage of using the on screen NXT display so that you can see values as you troubleshoot your code.

Programming/Remote Control

The screenshot shows a web interface for the ROBOTC curriculum. At the top is a navigation bar with buttons for HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control (which is highlighted), and INDEX. Below the navigation bar is a sidebar with three links: Programming Challenge, Remote Control Basics, Using Bluetooth, and TETRIX Engineering Challenge. The main content area is titled 'REMOTE CONTROL' and contains the following text:

REMOTE CONTROL

ROBOTC 2.0 brings the exciting world of remote control to the LEGO Mindstorms robot system. This set of lessons will teach you how to control your NXT robot system with its built in Bluetooth capability with a Logitech compatible remote control.

To complete this set of lessons you will need:

- A Bluetooth enabled NXT controlled robot
- A Bluetooth dongle
- A Logitech compatible remote control

At the bottom of the screenshot, it says 'ROBOTC® Curriculum for TETRIX® & LEGO® MINDSTORMS®'.

Programming/Remote Control

The Remote Control Unit teaches students how Bluetooth works, how to troubleshoot Bluetooth, and how to program their remote control unit. ROBOTC allows two Logitech remote control units to control one robot. All of the lessons in this curriculum are designed for one remote control unit. For more information on controlling one robot with two remote control units refer to the built in help in ROBOTC.

Everything that works with the NXT robot system with remote control also works with the TETRIX system.

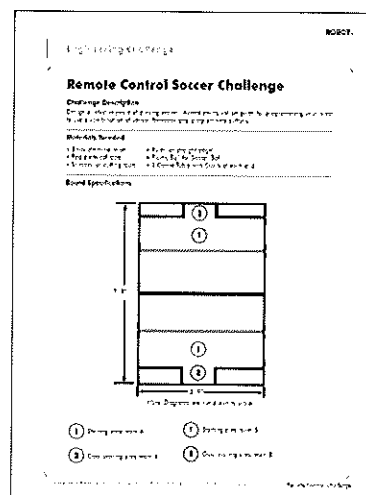

Programming/Remote Control/Programming Challenge

The screenshot shows a web interface for the ROBOTC Curriculum. At the top is a navigation bar with buttons: HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar with three buttons: Programming Challenge, Remote Control Basics, and Using Bluetooth. The main content area is titled "Programming Challenge" with the subtitle "Design a robot capable of playing soccer". It features a large image of a soccer field, a "Soccer Challenge" icon, and a "Solution Video" button. At the bottom, it says "ROBOTC Curriculum for TETRIX & LEGO MINDSTORMS".

Programming/Remote Control

The Remote Control Robot Soccer Programming Challenge provides a fun engineering/programming challenge that students of all levels enjoy. In the Remote Control programming unit, students will learn how to program the joysticks and buttons on their Logitech remote control units to produce desired behaviors like "kick the ball" or "drive straight". They already know how to program using the LEGO sensors, but there are a whole array of other third party sensors available that make the robot soccer challenge a great engineering/programming challenge. Two sensors that come to mind quickly are the compass sensor and the IR sensor. In the TETRIX lessons you will learn to program the IR sensor using ROBOTC and the compass sensor is very easy to program. The soccer challenge is a very good challenge at all levels middle school through adult hobbyist.

The following resources are available to preview the challenge:

Programming/Remote Control/Remote Control Basics

The screenshot shows a web interface for the ROBOTC Curriculum. At the top is a navigation bar with buttons: HOME, Fundamentals, Setup, Movement, Sensing, Variables, Remote Control, and INDEX. Below this is a sidebar with links: Programming Challenge, Remote Control Basics, Using Bluetooth, and TETRIX Engineering Challenge. The main content area is titled "Remote Control Basics" with the subtitle "Use a joystick controller to control your robot and assign behaviors to buttons". It features a four-step process: 1. How Remote Control Communication Works (with a video icon), 2. Using Remote Control, 3. Improving Remote Control (with a video icon), and 4. Using Buttons (with a video icon). Below these steps are links to "Install Joystick Controller", "Remote Control Basics Eng Lab", "Remote Control Buttons Eng Lab", "Remote Control Turn Button Challenge", and "Gripper Building Instructions". At the bottom of the page, it says "ROBOTC Curriculum for TETRIX & LEGO MINDSTORMS".

Remote Control Basics

The Remote Control Basics Lesson Set teaches students everything that they need to know to combine autonomous and remote control programming. This is a very powerful addition to the LEGO's already powerful NXT hardware. This Lesson Set contains two Remote Control Engineering Labs where students will be guided step-by-step toward a successful implementation of a combination of remote control and autonomous programming. The following resources are available to support this Lesson Set:

How Remote Control Communications Works Video - This video describes the communications between the Logitech Remote Control, the computer, and the NXT based robot.

Using Remote Control Video - In this lesson, students learn about include files, the new functions that are made available via the include file, and how the new functions map to the Logitech remote control.

Improving Remote Control Video - This lesson teaches students how to improve the joystick control via variable math and creating a dead zone on their remote control.

Using Buttons Video - This lesson teaches students how to program the buttons on the Logitech controller.

Install the Joystick Controller Reference - This is a reference PDF that helps to install and troubleshoot the Logitech remote controller installation.

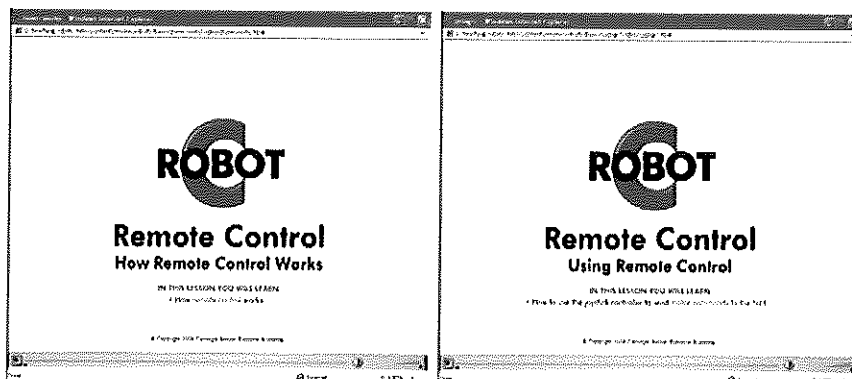

Remote Control Basics Engineering Lab - This lab provides step-by-step instructions designed to help a student to learn how to program the Logitech remote controller joysticks to control the NXT.

Remote Control Buttons Engineering Lab - This lab provides step-by-step instructions on how to write a program that enables the Logitech remote controller buttons to control the NXT.

Gripper Building Instructions - A set of instruction for students to use to build a LEGO gripper.

Engineering Info

Remote Control Basics

What are you going to do?

1. Use the remote control to send commands to the robot.
2. Use the remote control to send commands to the robot.
3. Use the remote control to send commands to the robot.
4. Use the remote control to send commands to the robot.
5. Use the remote control to send commands to the robot.
6. Use the remote control to send commands to the robot.

How are the communication signals sent?

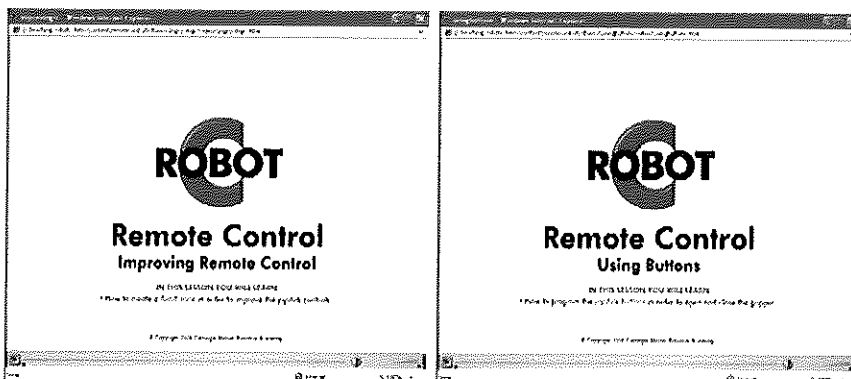

There are two ways to send signals: infrared (IR) and radio frequency (RF). IR signals are sent through the air, while RF signals are sent through the air and can be received by a robot.

How are the signals sent to the robot?

There are two ways to send signals: infrared (IR) and radio frequency (RF). IR signals are sent through the air, while RF signals are sent through the air and can be received by a robot.

Remote Control Basics

Logitech Joystick Controller Installation

Requirements:

- The USB Joystick Controller must be installed on the computer.
- The USB Joystick Controller must be installed on the computer.

Materials Needed:

- 1. Logitech Joystick Controller
- 1. USB Joystick Controller
- 1. USB Joystick Controller

Logitech USB Joystick Installation:

Plug the Logitech Joystick Controller into the USB port.

Windows Installation:

Plug the Logitech Joystick Controller into the USB port.

Notes:

1. Use the Logitech Joystick Controller to control the robot.

Building Instructions

Gripper

Engineering Challenges

Remote Control - Turn Button Lab

Challenge Description:

Using a remote control, turn the robot 90 degrees to the right.

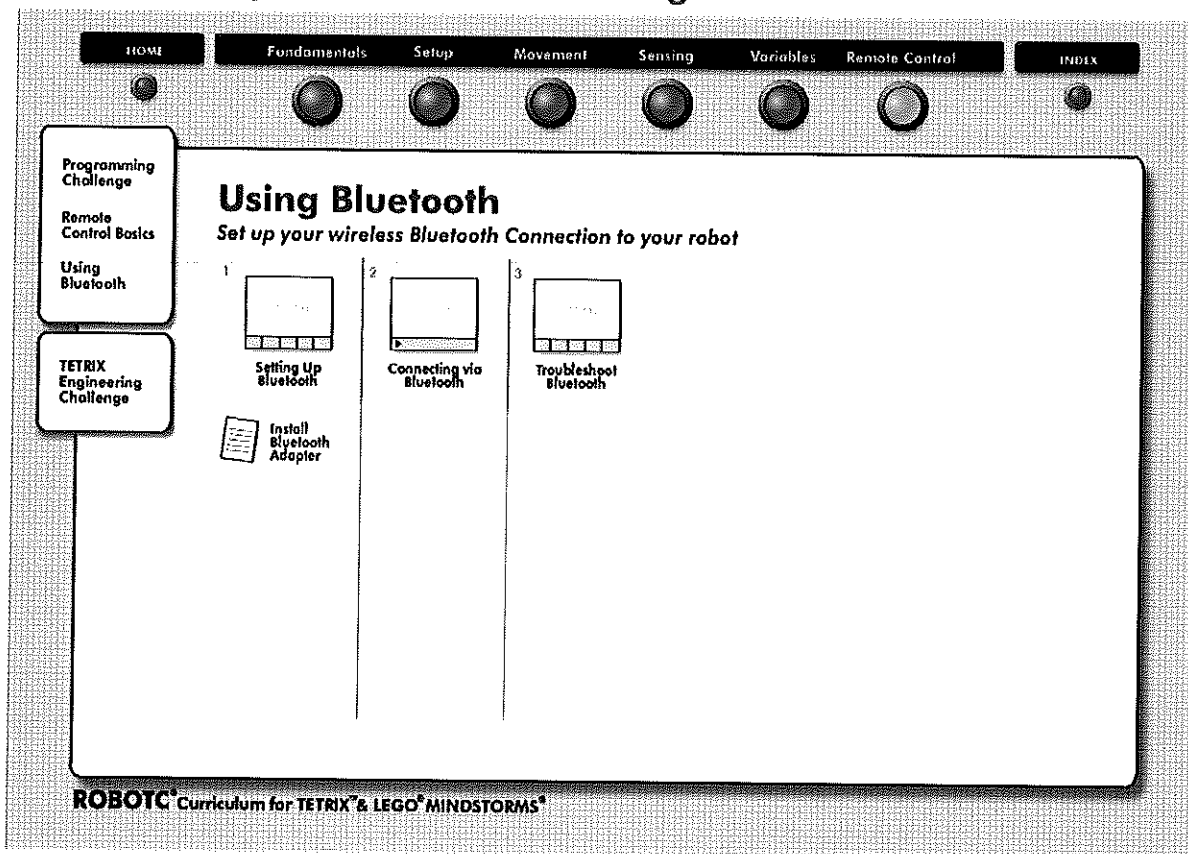

Materials Needed:

- 1. Remote Control
- 1. Remote Control
- 1. Remote Control

Basic Specifications:

1. Turn the robot 90 degrees to the right.

Programming/Remote Control/Using Bluetooth

Using Bluetooth

The Using Bluetooth Lesson Set is designed to help a first time user connect their computer to their NXT. There are four resources available in this section that have multiple components designed to ensure success.

The Setting Up Bluetooth Video Set - This Lesson Set focuses on answering the following questions: What is Bluetooth? How do I rename my NXT so that it is easy for Bluetooth to recognize? and How do I ensure that my NXT is visible to my computer?

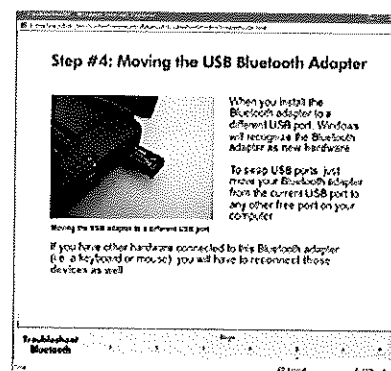

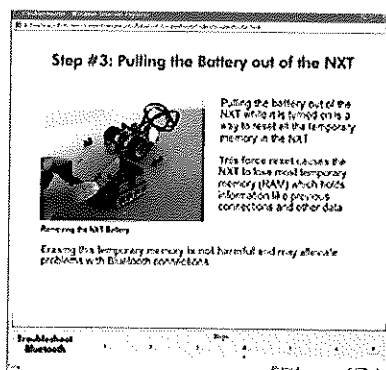

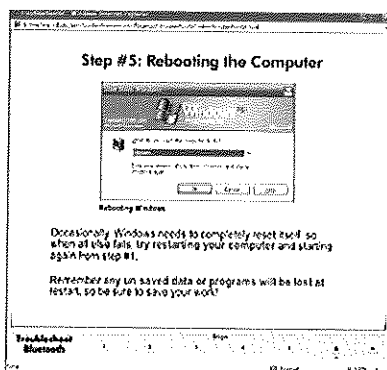

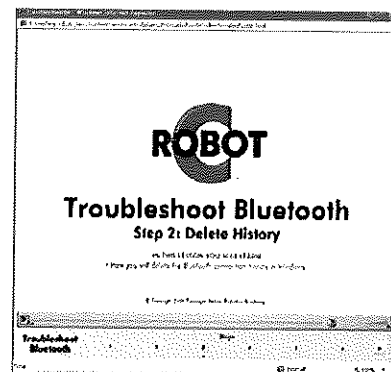

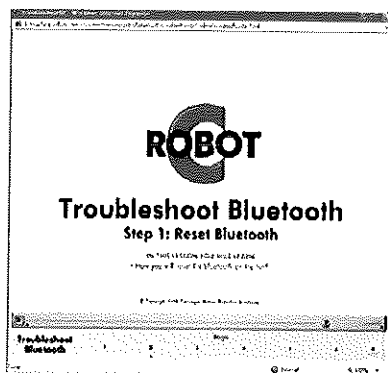

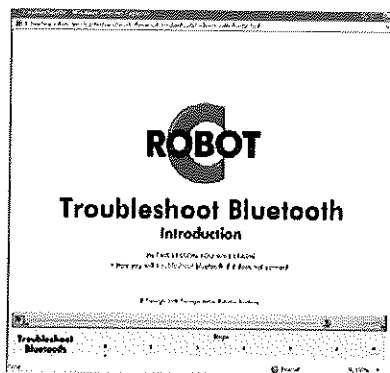

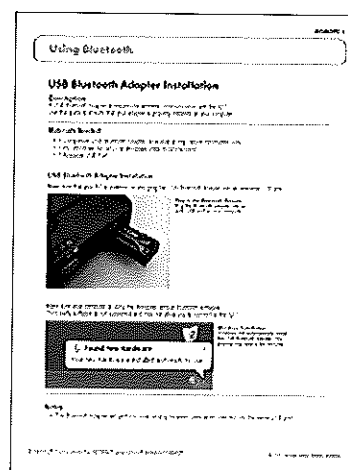

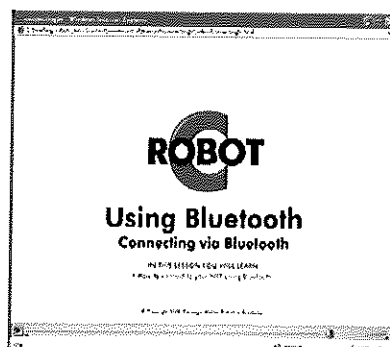

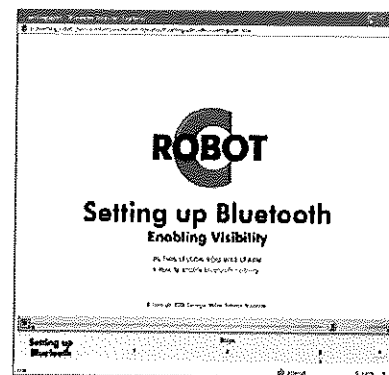

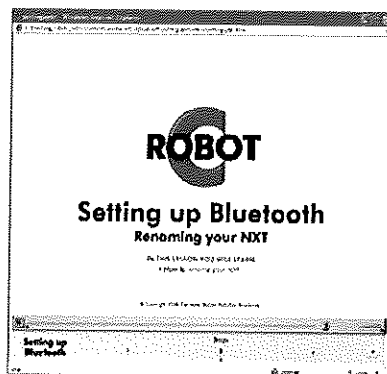

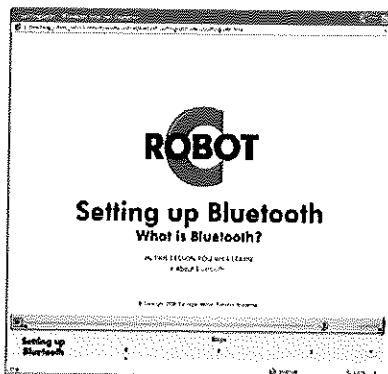

The Connecting Via Bluetooth Video - This video demonstrates step-by-step how to connect via Bluetooth using ROBOTC.

The Troubleshooting Bluetooth Video Set - This troubleshooting guide consists of six things to consider if your Bluetooth connection isn't working.

Installing your Bluetooth Adaptor Reference Guide - A one page handout that describes the Bluetooth adaptor.

ROBOTC Curriculum for TETRIX™ & LEGO® MINDSTORMS®

TETRIX

This curriculum assumes that the student has completed all of the NXT lessons *before* they start the TETRIX section. We've chosen to introduce the TETRIX training materials that way because it is easier to learn a system with less inputs and outputs before a student begins to learn a more complicated system.

The TETRIX hardware and building system is well supported in this curriculum. The developers of ROBOTC have invested man-years of time developing an interface that uses programming wizards that make the integration of the NXT hardware with the TETRIX controllers and new sensors very achievable for high school level students. The movements section is designed to introduce students to similarities between using ROBOTC with the NXT system and ROBOTC with the TETRIX system. The Movement Lesson Set includes the following video resources:

Moving Forward Video - This lesson is designed to show the easy transition from the NXT robot system to the TETRIX robot system. Students will learn how to change platform types and how to name the TETRIX motors using ROBOTC.

Motors and Sensors Setup Video SET - This Lesson Set is a six video set where students learn to configure the motors and sensors configuration window. In this Lesson Set they will learn: what pragma statements are, how to configure the motor and setup window for the controllers that they are using with their TETRIX robot system, how to enable motors, how to reverse polarity of the motors, and how to rename motors using the motor and setup configuration window.

TETRIX Speed and Direction Video - This lesson teaches students how to change the robot's speed and direction.

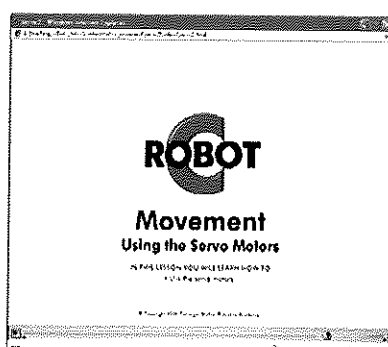

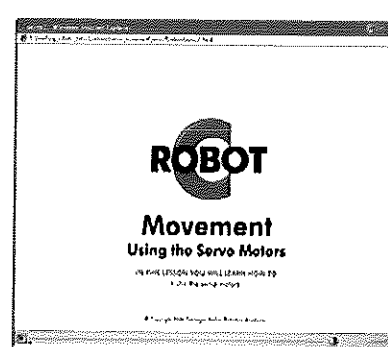

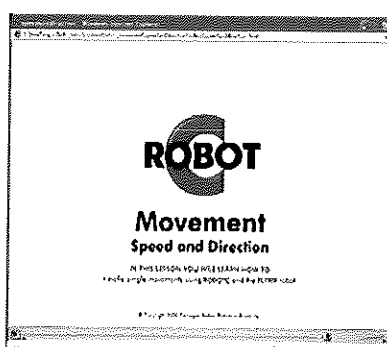

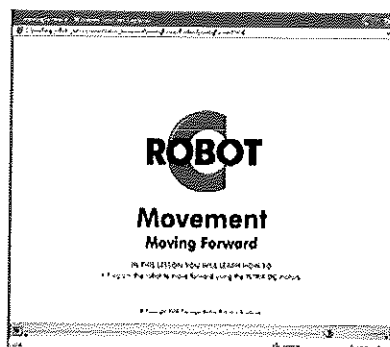

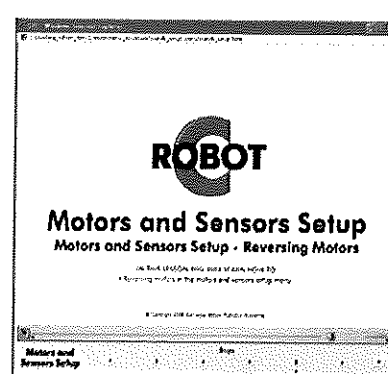

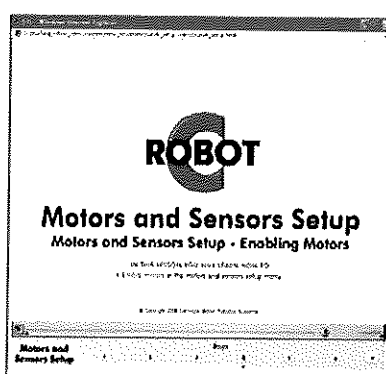

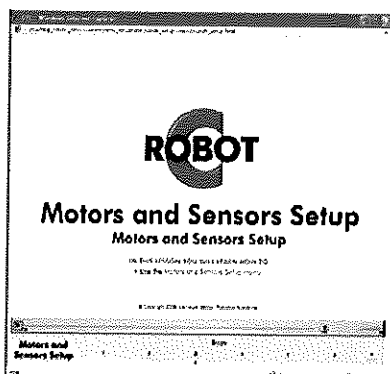

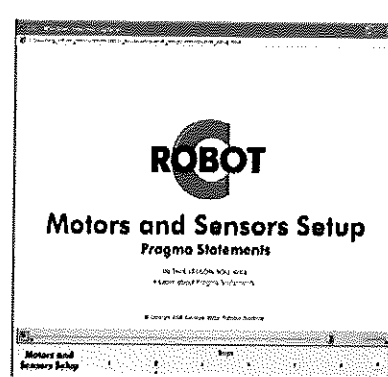

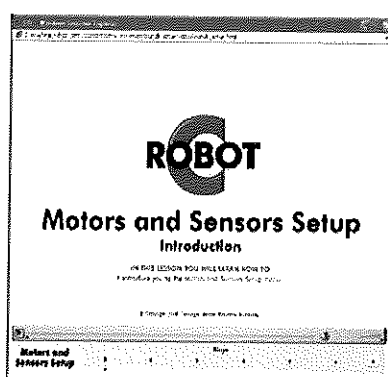

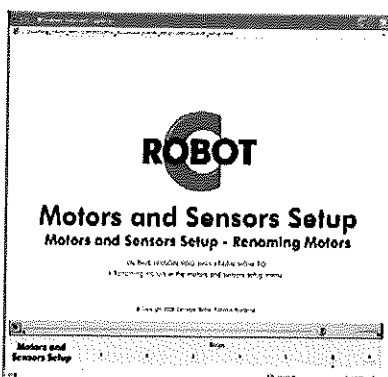

Introduction to Servo Motors Video - This lesson teaches students what servo motors are. They learn the difference between servos and DC motors as well as the servo motor's advantages and limitations.

Using Servo Motors Video - This lesson teaches students how to program servos using ROBOTC.

Debugging Servos Video - This lesson teaches students how to use the powerful servo configuration window to program their servos locations.

TETRIX Movement

TETRIX Video Resources

TETRIX Movement

TETRIX Print Resources

TETRIX Movement PDF - This is a printable version of the videos in the TETRIX Movement Lesson Set designed to complement the videos and provide a study guide for students.

Drive Straight Lab - This lab is designed to introduce students to the difference in control between the NXT robot system and the TETRIX robot system. Without encoders students will need to modify the robot's motor power in order to move straight.

Turning Engineering Lab - This lab enables students to iteratively test their robot's ability to achieve accurate turns.

Wait States Power Level Engineering Lab - The TETRIX motors move much faster than the NXT motors. This engineering lab is designed so that students setup an experiment, collect data, and analyze the difference between the NXT and TETRIX motors.

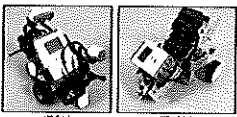

TETRIX Servo Reference Handout - Servos are different than DC motors. This reference explains how servos work.

Using Servos Engineering Lab - This engineering lab is designed to guide students through a step-by-step experience where they learn to use TETRIX servos and ROBOTC's servo configuration menu.

TETRIX™ Programming

Downloading a Program Moving Forward

In the first part of our two-part guide, we showed you how to download a program to the TETRIX robot. In this part, we'll show you how to download a program to the TETRIX robot using the ROBOTC software.

Goal:

Download a program to the TETRIX robot using the ROBOTC software.

Steps:

1. Connect the TETRIX robot to the computer using the USB cable.
2. Open the ROBOTC software.
3. Click on the 'Download' button in the top right corner.
4. Select the program you want to download.
5. Click on the 'Download' button in the dialog box.

Result:

The program is downloaded to the TETRIX robot and is ready to be executed.

Engineering Lab

TETRIX Driving Straight Challenge

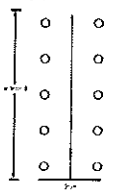

Problem:

Driving a robot straight is a challenge because the two wheels on the robot are not perfectly aligned. This means that the robot will tend to drift to the left or right as it moves forward.

Challenge Description:

Write a program that drives the robot straight for a distance of 100 cm. The robot should start at the center of the field and end at the center of the field.

Challenge Specifications:

Goal:

Drive the robot straight for a distance of 100 cm.

Engineering Lab

TETRIX Wait States/Power Level Investigation

Investigation Summary:

The TETRIX robot has a different motor speed than the NXT robot. This means that the robot will move faster than the NXT robot when the same power level is used.

Goal:

Investigate the difference in motor speed between the TETRIX and NXT robots.

Steps:

1. Set up the TETRIX robot and the NXT robot.
2. Write a program that drives the robot for a fixed amount of time.
3. Measure the distance the robot travels.
4. Compare the results for the TETRIX and NXT robots.

Result:

The TETRIX robot travels a greater distance than the NXT robot when the same power level is used.

Data Table:

Power Level	TETRIX Distance (cm)	NXT Distance (cm)
100	100	100
75	75	75
50	50	50
25	25	25

Reference

Servo

A servo motor is a type of motor that can move a load to a specific position. It is commonly used in robotics for controlling the movement of a robot's arms, grippers, and other mechanical components.

TETRIX Servo Range of Motion:

Goal:

Control the movement of a servo motor using the TETRIX robot.

Steps:

1. Connect the servo motor to the TETRIX robot.
2. Write a program that controls the servo motor.
3. Test the program and observe the movement of the servo motor.

Result:

The servo motor is controlled by the TETRIX robot and moves to the specified position.

ROBOTC® Curriculum for TETRIX™ & LEGO® MINDSTORMS®

TETRIX Sensing

The TETRIX Sensing Lesson Set teaches: how the TETRIX controller works, how to program the TETRIX encoders to allow your robot to accurately move point to point, how to use the LEGO smart motors as encoders for the TETRIX DC motors, and how to program the IR sensor to work with the TETRIX robot system. All sensors that work with the LEGO NXT works with the TETRIX system. The following video resources support this Lesson Set:

TETRIX Controller Overview Video - This lesson teaches how ROBOTC, the NXT, and the TETRIX controllers communicate.

TETRIX Encoders Moving Forward Video - This lesson teaches how the TETRIX encoders work.

TETRIX Encoders nMotorEncoder Video - This lesson teaches how to program the TETRIX motors using the nMotorEncoder function.

TETRIX Encoder Targets Part 1 Video - This lesson teaches how the nMotorEncoderTarget function works with the nMotorRunState function to allow very accurate movement of the TETRIX hardware system.

TETRIX Encoder Targets Part 2 Video - This videos show how to program TETRIX using nMotorEncoderTarget.

LEGO Motor as Encoder Part 1 Video - This lesson introduces how you can use the LEGO smart motors as encoders for the TETRIX system if you do not have the TETRIX encoders.

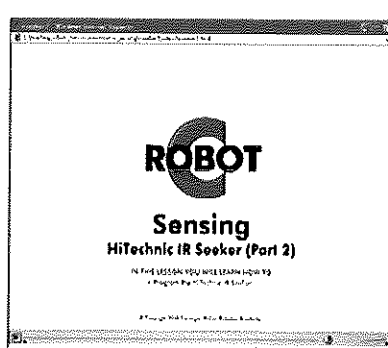

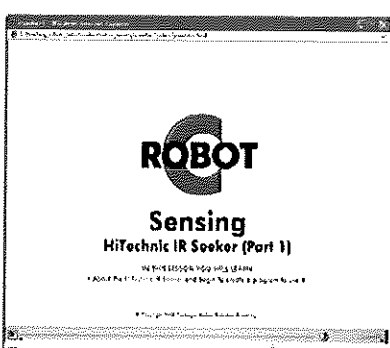

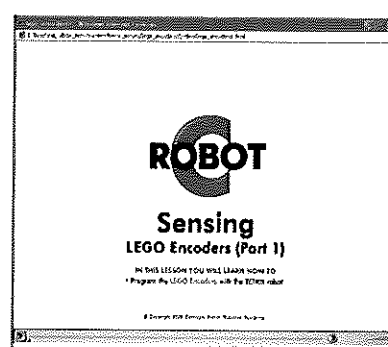

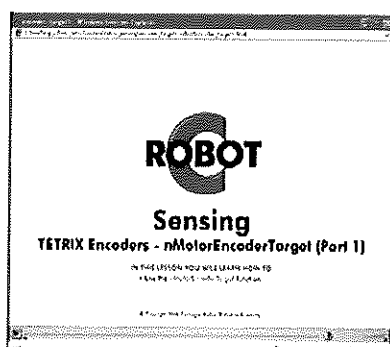

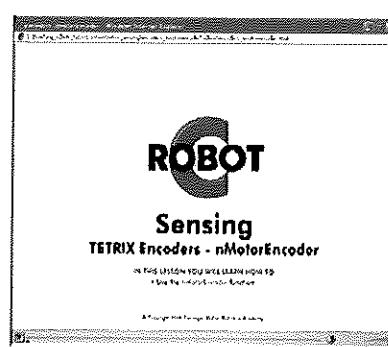

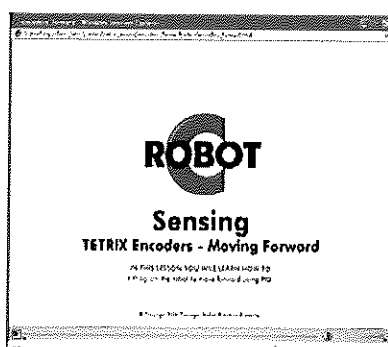

LEGO Motor as Encoder Part 2 Video - This video shows how to write a program that uses the LEGO smart motors as an encoder for the TETRIX system.

HiTechnic IR Seeker Part 1 Video - This lesson shows conceptually how the IR seeker is programmed.

HiTechnic IR Seeker Part 2 Video - This video shows how to write the program for the IR seeker.

TETRIX Sensing

TETRIX Sensing Video Resources

TETRIX Sensing

TETRIX Sensing Print Resources

TETRIX Sensing PDF Print Resources - This PDF is a print version of the videos that are included in the TETRIX Sensing Lesson Set.

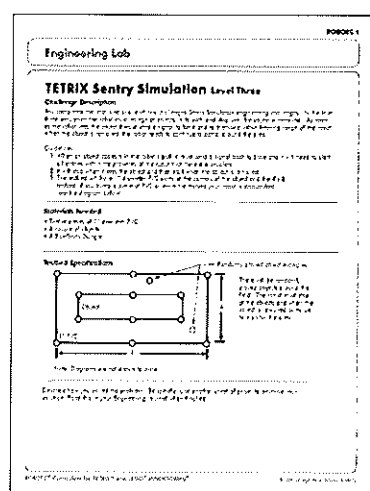

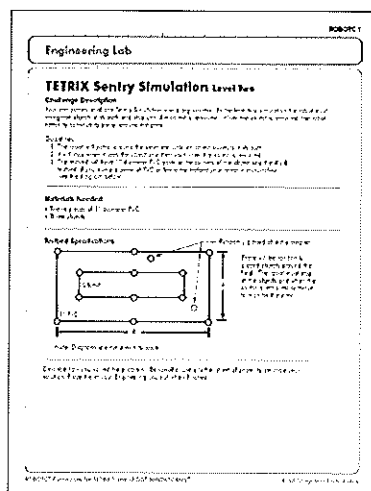

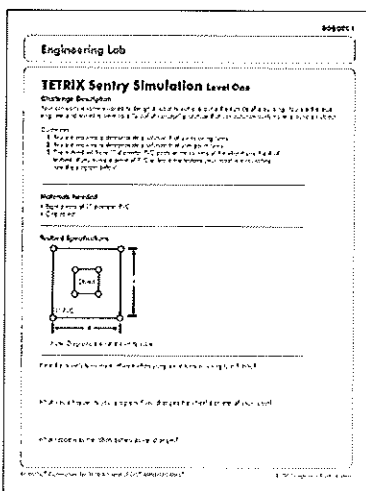

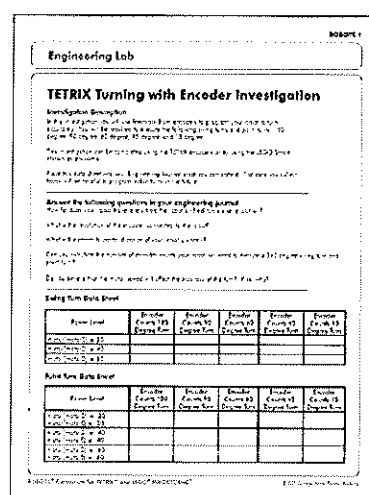

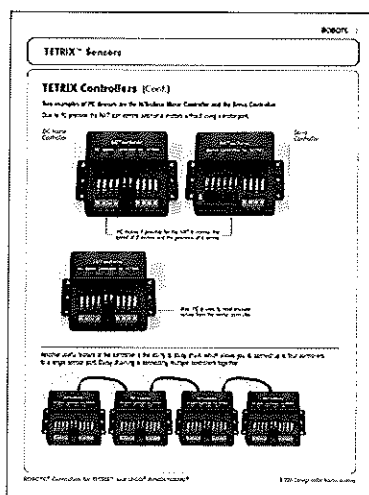

Power Level Engineering Lab - In this lab students will change the power level and keep the TETRIS encoder value the same and see if there is a proportional relationship between power level and distance traveled.

Turning with Encoder Engineering Lab - In this lab students will find the encoder value of a specific angle turn and then predict and test for other encoder values for turns. Students will do this for both point and swing turns.

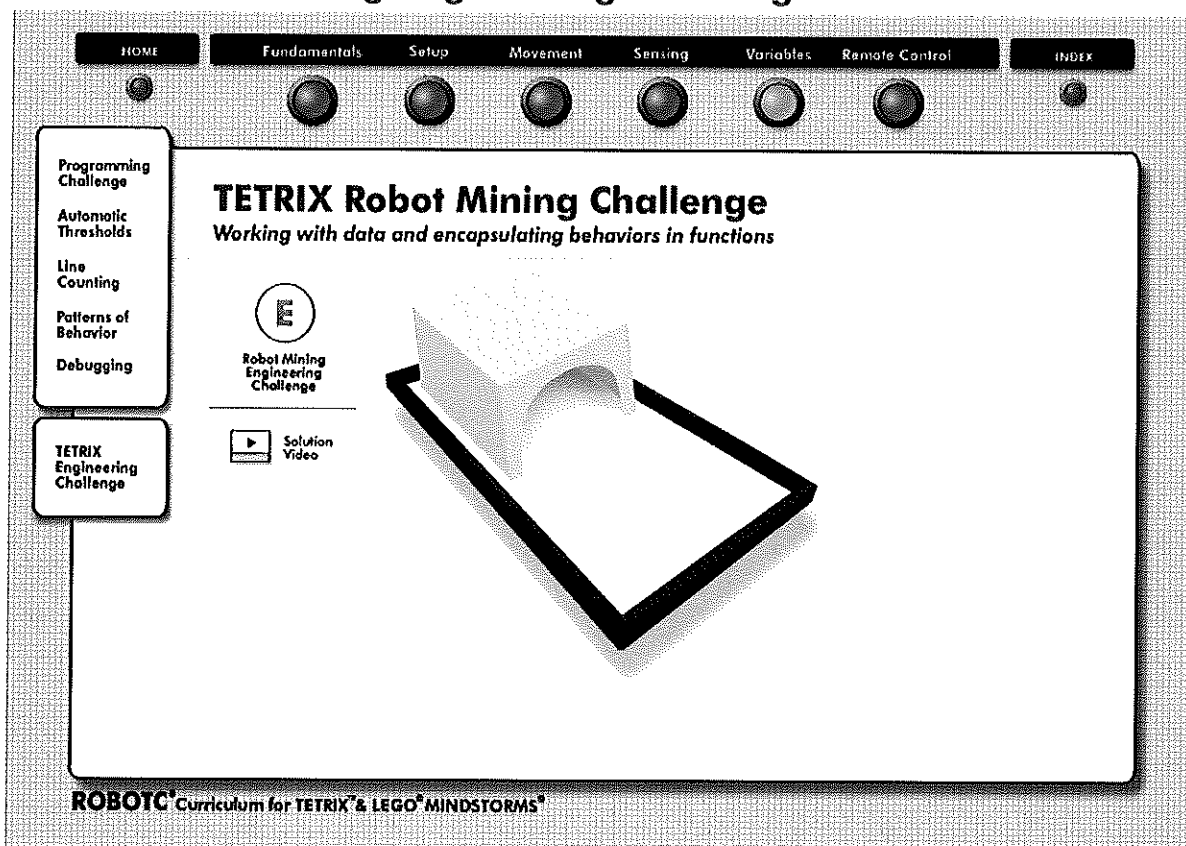

Sentry Simulation Level 1 - Students develop a robot solution of a sentry robot.

Sentry Simulation Level 2 - Students develop a robot solution of a sentry robot that is able to identify objects in the robot's path and react to the objects.

Sentry Simulation Level 3 - Students develop a robotic solution of a sentry robot that identifies intruders, sounds an alarm, and sends data back to the host computer via Bluetooth.

TETRIX Robot Mining Engineering Challenge

TETRIX Robot Mining Challenge

The Robot Mining Challenge is a 6 - 9 week engineering design problem. This challenge involves both research and engineering. Students are required to think about solving a large problem in the mining industry. They are given an "RFP" (a request for proposal) that they are to respond to. They will conduct research to evaluate the types of solutions currently being employed in the mining industry to map mines and then they are to develop a robotic prototype of their solution. The prototype can be solved using a LEGO NXT only solution or a TETRIX solution. This engineering problem is supported with the following resources:

TETRIX Engineering Challenge Solution Video - This video shows a TETRIX robot going into a simulated mine, the video includes a screen shot of what the command center might see in the student's mapping solution.

The Robot Mining Engineering Design Challenge - This challenge is build around a four step process: research, plan, prototype, and iteratively test potential engineering solutions. Each section of the engineering problem has a set of resources to support the problem solver as well as a description of what the student should be collecting for their engineering design notebook.

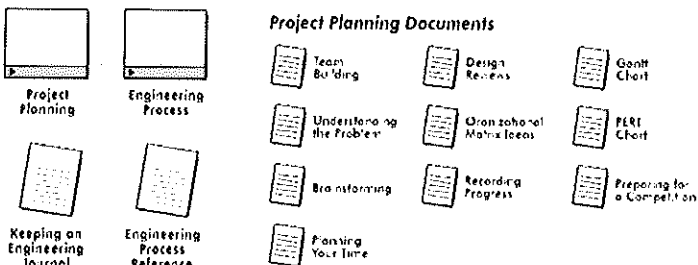

Research Investigations - There are three research investigations that the engineering design team is responsible to complete: Choosing a Sensor, Scanning and Mapping, and Remote Communications. There may be other teacher assigned research if the student has access to the additional resources. For instance, if their solution implemented a camera, then students would need to conduct research on the best camera solution and why.

Printed Project Requirements - The Robot Mining Engineering Challenge has a set of embedded print resources to help the student manage the project. The resources include: a project level planner, a preview of the final demonstration deliverables, time management tools, responsibility matrixes, design specifications, a scoring rubric, and more.

TETRIX Robot Mining Engineering Challenge

Project Management

It doesn't matter what career you choose it will be important to be able to manage projects and apply engineering processes to solve problems. The links below contain resources that you will find helpful as you solve design problems.

Resources in Fundamentals

The project management resources found in the fundamental section of the curriculum will be used extensively to solve this engineering design problem. Pictured on the left are a list of resources found in the fundamentals section.

TETRIX Robot Mining Challenge Print Resources

Student Assignment

Mine Mapping: Final Demonstration
Mine Mapping Engineering Project > Test Phase

Assignment
Your job is to make a final presentation to the judges. You will be asked to explain the design of your robot and the results of your testing. You will also be asked to answer questions about the design process.

Criteria & Scoring
Your final presentation will be scored on the following criteria:

- 1. Design of the robot (20 points)
- 2. Results of the testing (20 points)
- 3. Explanation of the design process (20 points)
- 4. Quality of the presentation (20 points)

Design of the robot
The design of the robot will be scored on the following criteria:

- 1. Functionality (10 points)
- 2. Efficiency (10 points)

Results of the testing
The results of the testing will be scored on the following criteria:

- 1. Accuracy (10 points)
- 2. Precision (10 points)

Explanation of the design process
The explanation of the design process will be scored on the following criteria:

- 1. Clarity (10 points)
- 2. Depth (10 points)

Quality of the presentation
The quality of the presentation will be scored on the following criteria:

- 1. Organization (10 points)
- 2. Delivery (10 points)

Student Assignment

Mine Mapping: Research Report
Mine Mapping Engineering Project > Test Phase

Assignment
Your job is to write a research report about the design of your robot. The report should include the following information:

- 1. Introduction
- 2. Design of the robot
- 3. Results of the testing
- 4. Conclusion

Design of the robot
The design of the robot should include the following information:

- 1. Functionality
- 2. Efficiency

Results of the testing
The results of the testing should include the following information:

- 1. Accuracy
- 2. Precision

Conclusion
The conclusion should include the following information:

- 1. Summary of the design process
- 2. Final thoughts on the design

Mine Mapping: Final Demonstration -

This handout describes how the solution will be evaluated.

Mine Mapping: Request for Proposal

This document describes the project requirements.

Mine Mapping: Research Report -

Describes a student assignment that requires them to write up what they've learned during the project.

Mine Mapping: Marketing Presentation -

Describes the requirements for the end of the project presentation.

Conducting Tests - A set of guides to

setup fair tests to analyze the project prototype's success.

Student Assignment

Mine Mapping: Marketing Presentation
Mine Mapping Engineering Project > Test Phase

Assignment
Your job is to make a marketing presentation about the design of your robot. The presentation should include the following information:

- 1. Introduction
- 2. Design of the robot
- 3. Results of the testing
- 4. Conclusion

Design of the robot
The design of the robot should include the following information:

- 1. Functionality
- 2. Efficiency

Results of the testing
The results of the testing should include the following information:

- 1. Accuracy
- 2. Precision

Conclusion
The conclusion should include the following information:

- 1. Summary of the design process
- 2. Final thoughts on the design

Student Assignment

Mine Mapping: Following Proposal
Mine Mapping Engineering Project > Test Phase

Assignment
Your job is to follow the proposal and make a final presentation. The presentation should include the following information:

- 1. Introduction
- 2. Design of the robot
- 3. Results of the testing
- 4. Conclusion

Design of the robot
The design of the robot should include the following information:

- 1. Functionality
- 2. Efficiency

Results of the testing
The results of the testing should include the following information:

- 1. Accuracy
- 2. Precision

Conclusion
The conclusion should include the following information:

- 1. Summary of the design process
- 2. Final thoughts on the design

Project Planning

Testing
Your job is to make a testing plan for the design of your robot. The plan should include the following information:

- 1. Introduction
- 2. Design of the robot
- 3. Results of the testing
- 4. Conclusion

Design of the robot
The design of the robot should include the following information:

- 1. Functionality
- 2. Efficiency

Results of the testing
The results of the testing should include the following information:

- 1. Accuracy
- 2. Precision

Conclusion
The conclusion should include the following information:

- 1. Summary of the design process
- 2. Final thoughts on the design

How Robotics Aligns with Standards

This section describes how robotics as a content area aligns with National Science, Mathematics, Technology, and Communications Standards. Below you will see the format that we use to show how robotics education aligns to national science, technology, engineering, and mathematics (STEM) standards.

Standard	Robotics Link
On the left is a description of the standard or particular point of the standard that is addressed through robotics.	On the right is a description of how robotics in general and this curriculum in particular addresses this standard.

Science Standards Addressed

From the National Science Education Standards (NSES)

Systems, Order, and Organization

The natural and designed world is complex; it is too large and complicated to investigate and comprehend all at once.

A system is an organized group of related objects or components that form a whole.

The goal of this standard is to think and analyze in terms of systems.

Science assumes that the behavior of the universe is not capricious, that nature is the same everywhere, and that it is understandable and predictable.

Prediction is the use of knowledge to identify and explain observation, or changes, in advance. The use of mathematics allows for greater or lesser certainty of predictions.

Order is the behavior of units of matter, objects, organisms or events in the universe – can be described mathematically.

Types and levels of organization provide useful ways of thinking about the world

Robots are excellent examples of systems, with many heterogeneous components interacting in organized, methodical ways to achieve results as a whole that they could not have achieved separately.

Examples include:

- Navigation systems (e.g. sensor tells the robot where it is, programmable controller tells the robot how to interpret this information, motors move in order to achieve the desired result)
- Sensing systems (electrical, mechanical, and programming elements of a sensor)
- Power & transmission systems (motor, axle, gear, wheel)
- Manipulator systems
- Lifting systems, vision systems, etc.

Each system can be broken down into subsystems.

Robotics technology is built upon a series of behaviors that can be measured mathematically and are understandable and predictable.

There are many examples that are easy for students to manipulate and understand:

- Gears and mechanical advantage
- Sensors and electronic control
- Wheel diameter and its effect on distance traveled
- Rotation sensor readings and robot path planning

Science Standards *continued*

From the National Science Education Standards (NSES)

Evidence, Models and Explanation

Evidence consists of observations and data on which to base scientific explanations. Using evidence to understand interactions allows individuals to predict changes in natural and designed systems.

Models are tentative schemes or structures that correspond to real objects, events, or classes of events that have explanatory power. Models help scientists and engineers understand how things work. Models take many forms, including physical objects, plans, mental constructs, mathematical equations and computer simulations.

Scientific explanations incorporate existing scientific knowledge and new evidence into logical statements. Terms like "hypothesis," "model," "law," "theory," and "paradigm" are used to describe various scientific explanations.

The investigations included in this curriculum allow students to collect evidence to investigate scientific principles. Robots physically demonstrate many scientific concepts to make them more clear and understandable.

Examples include:

- Electronics and basic circuitry, which can be demonstrated using touch sensors and the NXT power supply
- Gear trains, which demonstrate the ability to mathematically predict mechanical advantage and speed.
- Light sensors, which can detect infrared as well as visible light

Constancy, Change and Measurement

Although most things are in the process of becoming different – changing – some properties of objects and processes are characterized by constancy; the speed of light, the charge of an electron, the total mass plus energy of the universe.

Energy can be transmitted and matter can be changed. Nevertheless, when measured, the sum of energy and matter in the system, and, by extension, the universe, remains the same.

Mathematics is essential for accurately measuring change.

Different systems of measurement are used for different purposes.

Scale includes understanding that different characteristics, properties, or relationships with a system might change as its dimensions are increased or decreased.

Rate involves comparing one measured quantity with another measured quantity, for example, 60 meters per second.

Robots rely on the use of many innate constants in their basic operation. Ultrasonic sensors, for instance, calculate distance based around an assumed value for the speed of sound.

In calculating the distance a robot travels per spin of its motor, fundamental mathematical relationships govern the elements of change and constancy between the different factors involved. For example, the ratio between the diameter and circumference of the wheel is constant ($C=\pi d$). On the other hand, a robot doesn't always need to use the same wheels – they can change – yet, no matter what the size of the wheel, the distance traveled per turn of the wheel remains proportional.

Measurement is fundamental to all aspects of robotics, from matching dimensions of parts to ensure that they can connect properly, to measuring how far your robot went, to measuring how well a prediction matched a result.

Science Standards *continued*

From the National Science Education Standards (NSES)

Evolution and Equilibrium

Evolution is a series of changes, sometimes gradual and sporadic, that accounts for the present form and function of objects, natural systems and designed systems. The general idea of evolution is that the present arises from materials and forms of the past.

Equilibrium is a physical state in which forces and changes occur in opposite and off-setting directions. For example, opposite forces are of the same magnitude, or off-setting changes occur at equal rates.

Every robot design has a story. As they build and modify their robot designs, students can trace the evolution of their creation as they adapt it in different ways that allow it to complete different tasks, building upon lessons learned from their previous designs.

Equilibrium appears in many different forms as a design factor that students will encounter in designing their robots. For example, a robot's top speed is an equilibrium point between the physical force of friction and the force generated by the motor.

Form and Function

Form and function are complementary aspects of objects, organisms, and systems in the natural and designed world.

When designing robots, form always follows function.

Whether the design decision involves using large versus small wheels, making the motor power high versus low, or selecting the sensing device the robot will use, all decisions are based on what the robot is expected to do: its function. All of these decisions will affect the final shape of the robot: its form.

Science as Inquiry – Content Standard “A”

As a result of activities in all grades, all students should develop:

- Abilities necessary to do scientific inquiry
- Understanding about scientific inquiry

Students should be engaged in activities that:

- Begin with a question
- Allow them to perform an investigation
- Gather evidence
- Formulate an answer to the original question
- Communicate the investigative process and results

The guided investigations in Robotics Engineering are targeted at specific relevant questions about robotics technologies and concepts that lead to rich exploratory experiences.

Some investigations focus on specific portions of the inquiry process, such as evidence-gathering or hypothesis evaluation. Others begin with a question and seek an answer using general inquiry processes.

Explanation and evaluation are primary abilities applied in answering questions, not simply calculations or summarization.

Science Standards *continued*

From the National Science Education Standards (NSES)

Physical Science – Content Standard “B”

As a result of activities in all grades, all students should develop an understanding of:

- Properties and changes of properties in matter
- Motions and forces
- Transfer of energy

By using simple objects, such as rolling balls and mechanical toys, students can move from qualitative to quantitative descriptions of moving objects and begin to describe the forces acting on the objects.

Understanding of energy will include light, heat, sound, electricity, magnetism, and the motion of objects.

Robotics is able to demonstrate many applied physical concepts. Here are a few examples:

- Mechanical advantage (gears)
- Basic circuitry (sensor operation)
- Digital and analog electronics (sensors)
- Light (lamp, light sensor)
- Sound (ultrasonic, sound sensors)
- Speed (motors)
- Friction (robot movement)

Quantitative measurement is a staple of all investigations.

Science and Technology – Content Standard “E”

As a result of activities in all grades, all students should develop:

- Abilities in technological design
- Understandings about science and technology

Students should begin to differentiate between science and technology.

In the middle school years, scientific investigations can be completed by activities in which the purpose is to meet a human need, solve a problem, or develop a product rather than explore ideas about the natural world.

Robotics is the premier example of the marriage of science and technology, especially as related to the solving of problems or human needs.

Every investigation students conduct with the robot is motivated by the need to advance the performance of the robot in order to meet performance criteria, connecting the “need to know” with the “ability to do”.

Mathematics Standards Addressed

From the National Council of Teachers of Mathematics (NCTM)

Numbers and Operations

- Understand numbers, ways of representing number, relationships among numbers and number systems.
- Understand meaning of operations and how they relate to one another.
- Compute fluently and make reasonable estimates.

Robotics uses numbers and operations in nearly all lessons, for example:

- Calculating distance with rotational sensors (equations, equalities)
- Gears, gear ratios and speed (ratios and proportions)
- Light sensors and threshold (inequalities)
- Wheel circumference, radius and diameter (geometric relationships)

Algebra

- Represent and analyze mathematical situations and structures using algebraic symbols.
- Use mathematical models to represent and understand qualitative relationships.
- Analyze change in various contexts.

Robotics lessons that involve algebra include the following:

- Conditional statements (inequalities)
- Programming sensors and thresholds (inequalities)
- Measuring turns (equalities, solving equations)
- Gears and speed (ratios, direct and indirect proportionality)
- Passing parameters in functions

Geometry

- Precisely describe, classify, and understand relationships among types of two and three-dimensional objects using their defining properties.
- Specify location and describe spatial relationships using coordinate geometry and other representational systems.

Robotics situations involving geometry include:

- Wheel rotations and circumference (diameter, circumference)
- Identifying locations in order to program a robot to move from point to point (connected path segments)
- Interlocking gears and gear ratios (discrete combinations of radii)

Measurement

- Understand measurable attributes of objects and the units, systems, and processes of measurement.
- Apply appropriate techniques, tools and formulas to determine measurements.

Understanding the significance and meaning of measurements are central to the understanding of robotics:

- Distance the robot travels (linear measurement, meter stick)
- Amount a motor turns (angular measurement)
- Directional change of the robot (angular measurement, protractor)
- Speed of the robot (rate measurement, meter stick, built-in timer)
- Physical quantities measured by sensors (touch, sound, light, distance)
- Detectable region of a sensor (ultrasonic sensor, meter stick, 2D graph paper)

Mathematics Standards continued

From the National Council of Teachers of Mathematics (NCTM)

Problem Solving

- Build new mathematical knowledge through problem solving.
- Solve problems that arise in mathematics and other contexts.
- Apply and adapt a variety of appropriate strategies to solve problems.
- Monitor and reflect on the process of problem solving.

In the lessons, there are both guided and open-ended design problems that involve designing, building, and programming needed to create autonomous robots.

- How do I get a robot to move a certain distance? (solved through measurement and the verification and use of a proportionality relationship)
- What does the sound sensor measure? (solved by graphing the sensor readings with tones of varying volume and pitch, then seeing which one indicated an orderly relationship)

Reasoning and Proof

- Recognize reasoning and proof as fundamental aspects of mathematics.
- Make and investigate mathematical conjectures.
- Develop and evaluate mathematical arguments and proofs.
- Select and use various types of reasoning and methods of proof.

Reasoning in robotics comes in many different forms, including the following:

- Experimental reasoning, proof using measurements and physical evidence (Wheels and Distance)
- Reasoning using equations, proof by solving (Measured Turns)
- Reasoning about graphs, proof by observing trends (Frequency and Amplitude)

Communications

- Organize and consolidate their mathematical thinking through communications.
- Communicate their mathematical thinking coherently and clearly to peers, teachers, and others.
- Use the language of mathematics to express mathematical ideas precisely.

Activities and Engineering Labs requires documentation that allows student to reflect on what they have accomplished or experienced, and describe it or some aspect of it in their own words to someone else. Emphasis is placed upon explaining reasoning in addition to showing calculations.

The Engineering Design Challenge includes opportunities for students to communicate with their peers and teachers what they have learned and accomplished.

Connections

- Recognize and use connections among mathematical ideas.
- Understand how mathematical ideas interconnect and build on one another to produce a coherent whole.
- Recognize and apply mathematics in contexts outside of mathematics.

One of the strongest features of using robotics to teach math, science, engineering, technology and communications is its ability to make links between multiple disciplines. Students are able to take what they know and connect it to what they are learning, synthesizing new knowledge as they continue.

Technology Standards Addressed

From the International Technology Education Association (ITEA)

The Nature of Technology

1. Students will develop an understanding of the characteristics and scope of technology.
2. Students will develop an understanding of the core concepts of technology.
3. Students will develop an understanding of the relationships among technologies and the connections between technology and other fields of study.

All robotics activities provide excellent hands-on exposure to technology in use and development.

- Robotics activities feature linkages to advanced technologies that allow students to connect their designs to real-world needs and solutions
- Successful robot operation revolves around the application of systems concepts to make sensors, actuators, and other components work together
- Design processes take into account goals, resources, and trade-off factors to achieve optimal results
- Technology exists in proper context alongside applications in science, math, and engineering
- Several different technologies (e.g. desktop computer, USB/Bluetooth peripheral interface, mobile robotics controller, electromechanical sensors and actuators) are routinely used together in the operation of the MINDSTORMS robot system, and all are necessary for it to work

Technology and Society

6. Students will develop an understanding of the role of society in the development and use of technology.

Robotics Engineering Design Challenges are linked to real world problems that use similar technologies to accomplish tasks that fulfill a social and/or economic need in the real world. For example:

- For instance the robot mining project that is part of this curriculum addresses a real problem that mining industries face daily.

Some robot activities focus specifically on Human-Robot Interaction (HRI), an emerging field dealing specifically with psychological and design issues relating to the use of robots in human environments.

Design

8. Students will develop an understanding of the attributes of design
9. Students will develop an understanding of engineering design
10. Students will develop an understanding of the role of troubleshooting, research and development, invention and innovation, and experimentation in problem-solving.

Students gain first-hand experience with developing a functional robotic system in many activities, including:

- The Warehouse Programming Challenge
- The Robot Mining Challenge
- Teacher assigned robot problems

Technology Standards continued

From the International Technology Education Association (ITEA)

Abilities for a Technological World

11. Students will develop the ability to apply the design process
12. Students will develop the ability to use and maintain technological products and systems

Students will apply design processes continually while working with and developing the robot. Here are some basic examples:

- Solving engineering design problems
- Robotics Competitions

In the course of working with the robot, students will be responsible for the maintenance of their robots:

- Mechanical soundness (the robot needs to be kept in good enough condition to perform its tasks daily)
- Organizing information (students must keep good records to know how to use systems they initially designed days or weeks earlier)
- Troubleshooting (robots have problems—often—and students must be able to identify and solve these issues as they arise)

Students will work with many important technologies as part of the operation of the NXT system:

- Electronic microcontrollers (NXT)
- Desktop/laptop computer and software (NXT Programming Software, word processor for write ups, spreadsheets for data graphs)
- Peripheral interfaces (USB or Bluetooth wireless)
- Electromechanical systems (touch, light, rotation, sound, ultrasonic sensors)
- Electromechanical actuators (Interactive Servo Motors)

The Designed World

16. Students will develop an understanding of and be able to select and use energy and power technologies
17. Students will develop an understanding of and be able to select and use information and communications technologies
18. Students will develop an understanding of and be able to select and use transportation technologies
19. Students will develop an understanding of and be able to select and use manufacturing technologies

The TETRIX robot is an excellent example and integrator of many different designed technologies working together as a coordinated system.

- Power sources (battery technologies – rechargeable Lithium-Ion vs. disposable alkaline)
- Vehicle systems (all the robot's systems must work together in order to make it mobile, a viable platform for transportation of goods or as a platform to perform other work)
- Manufacturing and prototyping (robot must be built and modified using appropriate materials, plans and tools)
- Structural soundness and stability concepts are integral to the design of the robot's physical form.
- Communication between system components (desktop to VEX, sensors to VEX, VEX to motors)
- Communication technologies (USB vs. Bluetooth)

Reading, Writing, Listening, and Presenting

Communications skills developed through robotics

Engineering does not exist in a vacuum; it is highly interdisciplinary and highly social. Teamwork is a central foundation of Engineering, and communication is essential to smooth functioning of any engineering team. Students will find that highly developed communication skills are an absolute necessity for success.

Communications skills applied when working with Robots

Situation or Activity	Communications Concepts Applied
Maintain Engineering Design Notebook	Organization of information
Reach consensus on which of several student-proposed designs the team will build	Teamwork and group communication skills <ul style="list-style-type: none"> • Running and participating in meetings • Building consensus
Compose a compelling proposal to convince a (virtual) sponsor that their robot's development is worth funding	Formal persuasive composition Integrate self-conducted research into a piece that is not purely expository Technical writing <ul style="list-style-type: none"> • Explaining technical decisions and implementations to an audience that is not necessarily technically inclined
Document the team's progress and accomplishments daily	Documentation and accounting for time, resources, and progress
Undergo review and integrate feedback from experts	Review and feedback processes Learning to accept and respond to criticism
Choose from a variety of representations to best illustrate and communicate a point	Use many different formats of both technical and non-technical information, across different media: <ul style="list-style-type: none"> • Graphs • Charts • Tables/Matrices • Photographs • Sketches • Timelines • PERT and Gantt Charts • Multimedia presentation • Text
Use Bluetooth to communicate between two NXTs	Electronic communication paradigms (as opposed to human) Networking and connected devices
Establish a standard "language" for communicating between two NXTs	Electronic communication Basic principles of communication <ul style="list-style-type: none"> • Necessity of shared language • Encoding and interpretation
Programming the robot	Communicate instructions explicitly to a robot using a "foreign" language

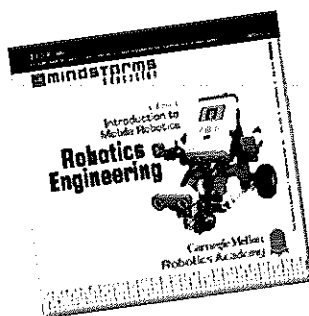

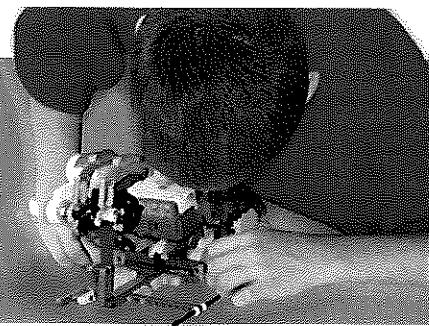

Reading, Writing, Listening, and Presenting continued

Communications skills developed through robotics

Communications skills applied when working with Robots

Situation or Activity	Communications Concepts Applied
Various interim deliverables intended for either internal or external use	<p>Examples</p> <ul style="list-style-type: none"> • Descriptive/Explanatory Composition: Describe behaviors, verbalize the functionality of parts of the program • Expository writing: How the machine works • Persuasive/Explanatory Composition: Justify a design choice • Record data in a table, evaluation of methods, predictions, describing robot behavior, describing a proportional relationship • Verbalize troubleshooting processes, analyzing and describing an unexpected situation or observation • Describe a design concept • Compare/contrast design choices, document and record steps, explain why the group took a certain approach • Research, examine and evaluate real-world robot applications • Describe a complex programming concept • Develop a marketing plan for a robot technology

The Carnegie Mellon Robotics Academy develops... Classroom-proven tools for teachers that foreground STEM concepts through hands-on minds-on robotics activities

Robotics Engineering Vol. I

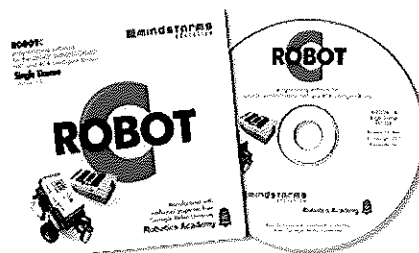

Introduction to Mobile Robotics CD-Rom

A standards-mapped, STEM-based curriculum with engaging activities, extensive resources, and complete teacher support...

- 18 lessons supported by video tutorials
- Building instructions & programming assistance
- Explanatory animations for each sensor
- Worksheets and data tables for each lesson
- Teacher notes and implementation suggestions
- Handouts and introductory Powerpoint presentations
- Quizzes, answer keys and evaluation rubrics
- Aligns to Math, Science, and Technology standards

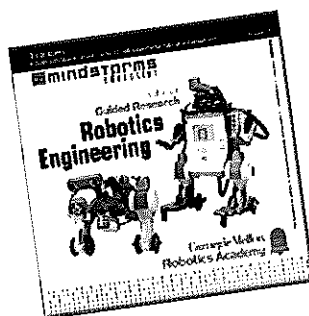

**Student learning that
contextualizes math, science,
technology and engineering**

ROBOTC Software

ROBOTC software

Specifically designed to program educational robots. Includes a user-friendly interface with basic and advanced programming options. Based on industry-standard C code and compatible with multiple robot hardware platforms.

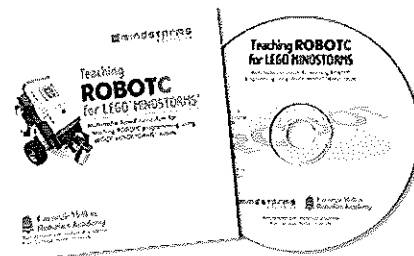

Robotics Engineering Vol. II

Guided Research CD-Rom / DVD

A learning continuum (with Vol. I) that features research, teamwork, and 'real world' engineering problem solving...

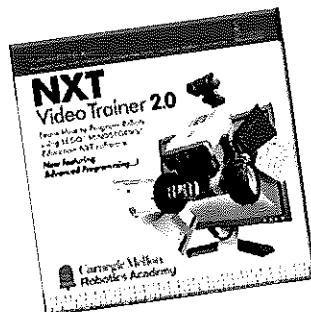

- Automated mining, patrol robot, and automated tree measurer projects where students learn advanced programming concepts
- 3 guided research and engineering challenges that build on the projects: mine mapping, creating a sentry system, & tree surveying
- Advanced programming videos on loops, switch blocks, data hubs, displaying real time data, storing variables, and Bluetooth
- Teacher notes & implementation suggestions, lesson handouts, evaluation rubrics, quiz answers. Aligns to Math, Science, Technology, and Communications standards

ROBOTC Curriculum

Teaching ROBOTC for LEGO MINDSTORMS

Curriculum includes over 45 short videos, over 300 pages of documentation, 20 programming challenges, and quizzes to check student understanding. Leads new programmers step-by-step into the world of industry-standard C-programming.

NXT Video Trainer 2.0 DVD

A self-paced guide for students & educators that teaches software programming for NXT-G through basics & beyond...

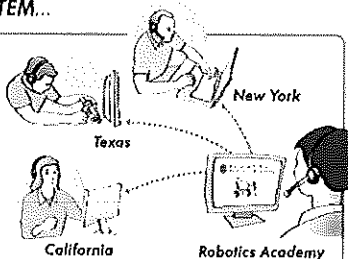

- Focused on introductory programming including motors, sensors, and decision-making
- Self-guided video lesson structure with regular 'check your understanding' questions
- Programming lessons paired with STEM investigations
- Classroom-ready with printable worksheets, teacher guide, and step-by-step video directions

Online Professional Development

A live online course that teaches you how to program NXT-based robots and how to use robotics as an organizer to teach STEM...

Course includes:

- USB headset (yours to keep afterward)
- NXT Video Trainer CD with classroom license (\$225 value)
- Online access to supplemental lessons
- Technical support
- Live access to instructors
- 24/7 access to class forums / message boards

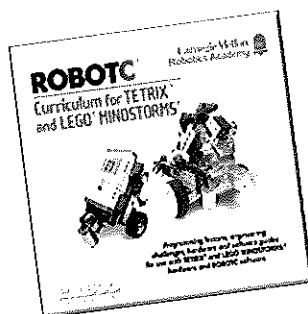

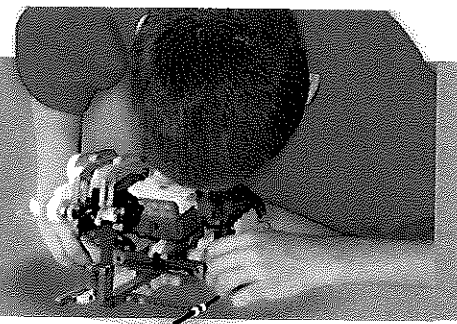

Robotics Curriculum
in over 6000 schools...

**Carnegie Mellon
Robotics Academy**

The Carnegie Mellon Robotics Academy develops... Classroom-proven tools for teachers that foreground STEM concepts through hands-on minds-on robotics activities

ROBOTC Curriculum

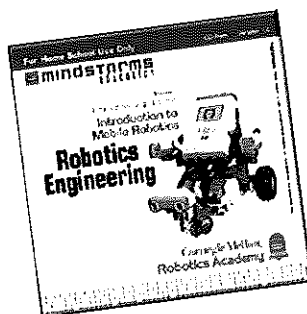

For TETRIX and LEGO MINDSTORMS CD-Rom

A multimedia curriculum that leads new programmers step-by-step into the world of industry-standard 'C' programming...

- Over 50 short videos help new users 'out of the starting gate'.
- Set-up section covers firmware, building your first bot, & more
- Students learn the role of a programmer, and what syntax is
- Lessons on autonomous control of a robot's speed & direction
- Challenges augment lessons with engaging scenarios
- Extensive coverage of sensor hardware and feedback
- Students learn how to use variables and create functions
- Aligns to Math, Science, and Technology standards

NXT

Robocamp-on-a-Disk

Robotics Engineering Vol. I

Home School CD-Rom

Single License for Home School use only

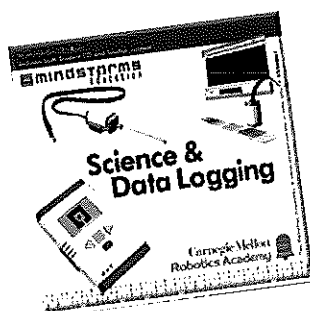

A standards-mapped, STEM-based curriculum with engaging activities, extensive resources, and complete teacher support...

- 18 lessons supported by video tutorials
- Building instructions & programming assistance
- Explanatory animations for each sensor
- Worksheets and data tables for each lesson
- Teacher notes and implementation suggestions
- Handouts and introductory Powerpoint presentations
- Quizzes, answer keys and evaluation rubrics

Deep Space Terraformers

Terraformers Camp-on-a-Disk CD takes campers on a mission to make a distant planet habitable for humans. Videos and animations help campers build robots, learn programming, tackle challenges, and hone their robotic and project planning skills.

Terraformers is perfect for a one week robotics camp or a 9-to-12 week after-school program. It provides extensive resources for a Robocamp director, including a step-by-step camp guide, registration forms, awards sheets, gameboard plans, themed props, and more.

Science & Datalogging

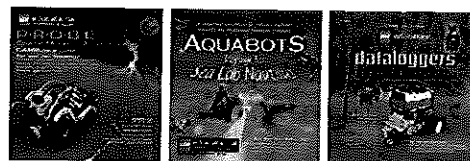

Investigations & Experiments CD-Rom

Introduces new programmers & scientists to the data logging capabilities of the NXT, including the temperature sensor...

- Six inquiry-focused STEM lessons and projects
- Teacher materials included for each lesson
- Over 40 short videos
- Accompanying worksheets, quizzes, and checks for understanding
- Building instructions for all programs
- Models designed to be built quickly by students in the classroom

RCX

Robocamps-on-a-Disk

Space, Oceans, Forests...

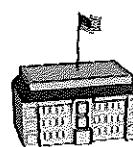

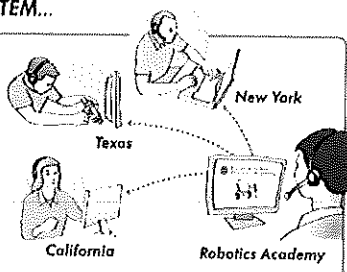

RCX Camp-on-a-Disk products are designed for the legacy RCX brick. They feature extensive resources including a Camp Guide that covers everything from planning to graduation, with recommended day by day activities. Prior experience teaching robotics or programming not required or assumed.
